

F01C

ROTARY-PISTON OR OSCILLATING-PISTON MACHINES OR ENGINES (internal-combustion aspects [F02B 53/00](#), [F02B 55/00](#))

Definition statement

This place covers:

Positive displacement machines, i.e. devices which could be equally an engine or pump, with rotary or oscillating pistons for elastic fluids or for combination of liquid and elastic fluid.

Relationships with other classification places

Related subclasses [F01C](#) and [F04C](#) cover the same type of apparatus using rotary or oscillating pistons for positive displacement. The distinguishing characteristic used for classifying the machines, i.e. devices which could be equally be an engine or pump, is the working fluid used. Machines with rotary or oscillating pistons for working fluids containing elastic fluids, e.g. a combination of liquids and elastic fluids are classified in [F01C](#). If only liquid is used as working fluid for these machines with rotary or oscillating pistons they are classified in [F04C](#). However, devices with rotary or oscillating pistons that are only pumps, i.e. cannot be used as engines, are classified in [F04C](#), irrespective of the working fluid.

Engines with reciprocating pistons or rotary or oscillating pistons wherein the working fluid is a liquid are classified in [F03C](#).

[F04B](#) covers machines or pumps with reciprocating pistons, or other kinds of positive displacement mechanisms with the exception of rotary or oscillating piston type machines or pumps.

Subject matter like cyclically operating valves, lubricating or cooling are classified in subclasses [F01L](#), [F01M](#), [F01P](#) irrespective of their stated application, unless their novel and non-obvious features are peculiar to their application, in which case they are classified only in the relevant subclass of [F04](#). The subclasses [F01L](#), [F01M](#), [F01P](#) do not cover pump or machine features per se.

Special rules of classification

As a general rule a complete classification will contain at least one class specifying the type of machine concerned, combined with at least one class out of the control group [F01C 20/00](#), or of the sealing group [F01C 19/00](#) or of the accessory group [F01C 21/00](#). The subgroups of [F04C](#) should be used for details not provided for in [F01C](#) and [F03C](#).

In cases where a control or a "Details, component, parts, or accessories" has to be classified which can be used in a number of different types of machines which would be covered by different subgroups, the type of machine considered in the document should be classified by using the corresponding Indexing Code. For details not provided for in [F01C](#), the Indexing Codes of the [F04C](#) scheme should be used.

The Indexing Code [F05C](#) is used to classify materials and material properties.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Cooperating members	means the "oscillating piston" or "rotary piston" and another member, e.g., the working-chamber wall, which assists in the pumping action or machine's action
Internal axis type	means that the rotational axes of the inner and outer co-operating members remain at all times within the outer member, e.g., in a similar manner to that of a pinion meshing with the internal teeth of a ring gear
Machine	means a device that could equally be both an engine and a pump and not a device which is restricted to an engine or one which is restricted to a pump
Movement of the cooperating members	is to be interpreted as relative, so that one of the "cooperating members" may be stationary, even though reference may be made to its rotational axis, or both may move
Oscillating piston machine	means a positive-displacement machine in which a fluid-engaging, work-transmitting member oscillates, e.g. a vane piston swinging back and forth about a fixed axis
Positive displacement engines	the energy of a working fluid is transformed into mechanical energy, in which variations of volume created by the working fluid in a working chamber produce equivalent movement of mechanical members, e.g. pistons transmitting the energy, the dynamic effect of the fluid being of minor importance

Positive displacement pumps	pumps using pistons or other mechanical members to displace a working fluid in a working chamber, the dynamic effect on the fluid being of minor importance
Pump	means a device for continuously raising, forcing, compressing, or exhausting fluid by mechanical means
Reciprocating piston	means a fluid-engaging, work-transmitting member of an reciprocating-piston type machine or pump that slides alternately back and forth usually along a straight line or path
Rotary piston	means a fluid engaging, work-transmitting member of a rotary-piston machine or pump that can completely rotate about a fixed axis or about an axis moving along a circular or similar orbit when operating, e.g. rotor having vanes or teeth
Rotary piston machine	means a positive-displacement machine in which a liquid-engaging, work-transmitting member rotates about a fixed axis or about an axis moving along a circular or similar orbit, e.g. machine with a rotor having vanes or teeth
Teeth or tooth equivalents	include lobes, projections or abutments
Working fluid	means the driven fluid in a pump or driving or driven liquid in a machine. The working fluid can be in a compressible, gaseous state, e.g. steam, called elastic fluid, a liquid state, or a state where there is coexistence of elastic fluid and liquid state

F01C 1/00

Rotary-piston machines or engines (with axes of co-operating members non parallel [F01C 3/00](#); with the working-chamber walls at least partly resiliently deformable [F01C 5/00](#); with fluid ring or the like [F01C 7/00](#); rotary-piston machines or engines in which the working fluid is exclusively displaced by, or exclusively displaces, one or more reciprocating pistons [F01B 13/00](#))
