

F22B

METHODS OF STEAM GENERATION; STEAM BOILERS (steam engine plants where engine aspects predominate [F01K](#); domestic central-heating systems using steam [F24D](#); heat exchange or heat transfer in general [F28](#); generation of vapour in the cores of nuclear reactors [G21](#))

Definition statement

This place covers:

This subclass covers general aspects of, or methods for, steam generation. Methods of steam generation characterised by the form of heating method, constructional features of steam boilers, control systems for steam boilers and all component parts or details of steam boilers are covered. Thereby this subclass is limited in only methods of, or apparatus for, the generation of steam under pressure for heating or power purposes.

Relationships with other classification places

Steam engine plants where engine aspects predominate are classified in [F01K](#), domestic central heating systems using steam are classified in [F24D](#), heat exchange or heat transfer in general is classified in [F28](#) and the generation of vapour in cores of nuclear reactors is classified in [G21](#).

Special rules of classification

Attention is drawn to the definition of "steam" and "vapour". In cases where a specific entry for vapour is missing, documents related to special vapours are classified in groups where only "steam" is explicitly mentioned.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Once through boiler	type of boiler, in which water is input at one side, and steam is extracted from the other side of the flow path
Forced flow boiler	Type of boiler, in which a pump ensures flow

Forced once through boiler	combination of a once through and a forced flow boiler (a pump ensures flow of a boiler in which water is input at one side, and steam is extracted from the other side of the flow path)
Forced circulation boiler	the circulation is achieved by a circulation pump
Natural circulation boiler	the circulation is achieved by the difference in density of the heated water in the boiler causing convection currents

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

HRSG	Heat Recovery Steam Generator
CFCB	Circulated Fluidized Combustion Bed
PFCB	Pressurized Fluidized Combustion Bed
AFCB	Atmospheric classic Fluidized Combustion Bed (Bubbling bed)

F22B 1/00

Methods of steam generation characterised by form of heating method (solar heating [F24S](#); jackets or other cooling means in which steam is generated and which serve for cooling other apparatus, see the subclasses for such apparatus)

Definition statement

This place covers:

Methods of steam generation

- using combustion of hydrogen with oxygen,
- using solar heat
- by the exploitation of the heat content of hot heat carriers, for example the heat carrier being hot slag, hot residues, or heated blocks of the heat carrier being molten like a molten metal, the heat carrier being hot liquid or hot vapour (i.e. steam), the heat carrier being a hot gas (i.e. waste gas or exhaust gas)
- using heat evolved in a solution absorbing steam like for example soda steam boilers
- using combustion under pressure substantially exceeding atmospheric pressure
- boilers heated electrically

Relationships with other classification places

Use of waste heat of combustion engines, in general, is classified in [F02G](#), solar heat collectors per se in [F24S](#), Heat pipes in [F28D 15/02](#). When steam is produced and explicitly mentioned as being superheated steam [F22G](#) should be consulted.

F22B 3/00

Other methods of steam generation; Steam boilers not provided for in other groups of this subclass

Definition statement

This place covers:

This covers all other methods of steam generation and steam boilers, which are not covered by the group [F22B 1/00](#). These methods of steam generation and steam boilers include involving working media other than water, steam generation by drop in pressure of high-pressure hot water within pressure reducing chambers, by transformation of mechanical (kinetic) energy into heat energy and steam generation at critical or supercritical pressure values.

Relationships with other classification places

Methods for superheating steam are classified in [F22G](#)

Instantaneous boiler with rotating heat exchange elements	F22B 27/12
Steam generation plants with a boiler of furnace tube type and a boiler of water tube type	F22B 33/04

F22B 7/00

Steam boilers of furnace-tube type, i.e. the combustion of fuel being performed inside one or more furnace tubes built-in in the boiler body

Definition statement

This place covers:

Boilers in which combustion of fuel is performed inside one or more furnace-tubes running through a sealed container of water. Combustion heat is transferred through the walls of the tubes by thermal conduction, thereby heating water and creating steam. The group also covers steam boilers of furnace-tube type with auxiliary water tubes inside the furnace tube and outside the boiler body, with auxiliary fire tubes and component parts of the boiler, like for example walling of flues. Components and accessories of the furnace-tubes itself are classified in [F22B 37/06](#).

Relationships with other classification places

The following types of steam boilers are covered by the following classification schemes:

- Steam boilers of drum type are classified in [F22B 5/00](#).
- Steam boilers of fire-tube type are classified in [F22B 9/00](#).
- Steam boilers of combined fire-tube type and water-tube type are classified in [F22B 11/00](#).
- Steam boilers of fire box type are classified in [F22B 13/00](#).
- Steam boilers of water-tube type are classified in [F22B 15/00](#), [F22B 17/00](#), [F22B 19/00](#) and [F22B 23/00](#).

Steam generation plants comprising boilers of furnace-tube type in mutual association with a boiler of fire-tube type	F22B 33/06
Auxiliary devices for promoting water circulation fitted to furnace tubes	F22D 7/02

Special rules of classification

Steam boilers with drums having a furnace tube or a furnace box also in combination with drums contacted externally with flue gases should be classified in [F22B 7/00](#) and [F22B 13/005](#). This applies also to boilers with special shape of furnace tube and subsequent flue.

F22B 9/00

Steam boilers of fire-tube type, i.e. the flue gas from a combustion chamber outside the boiler body flowing through tubes built-in in the boiler body

Definition statement

This place covers:

Boilers in which hot flue gases from a combustion chamber outside the boiler body said body being a sealed container, are channelled through tubes built-in the boiler body that are surrounded by the fluid to be heated. Heat of the gases is transferred through the walls of the tubes by thermal conduction, heating the water and creating steam. This group covers also arrangements of the fire-tubes and the boiler as well as components of the boiler itself.

Relationships with other classification places

The following types of steam boilers are covered by the following classification schemes:

- Steam boilers of drum type are classified in [F22B 5/00](#).
- Steam boilers of furnace-tube type are classified in [F22B 7/00](#).
- Steam boilers of combined fire-tube type and water-tube type are classified in [F22B 11/00](#).
- Steam boilers of fire box type are classified in [F22B 13/00](#).
- Steam boilers of water-tube type are classified in [F22B 15/00](#), [F22B 17/00](#), [F22B 19/00](#) and [F22B 23/00](#).

Steam generation plants comprising boilers of water tube-type in mutual association with a boiler of fire-tube type	F22B 33/08

Special rules of classification

In this group boilers which are mainly of fire-tube type are classified. If the boiler contains also water tubes, the boiler is considered of being a combined fire-tube and water-tube boiler. Concerned documents should be classified in [F22B 11/00](#).

F22B 11/00

Steam boilers of combined fire-tube type and water-tube type, i.e. steam boilers of fire-tube type having auxiliary water tubes

Definition statement

This place covers:

All combinations of the steam boilers of fire-tube type with steam boilers of water-tube type consisting of a fire-tube boiler with auxiliary water tubes or a water-tube boiler having auxiliary fire-tubes in a water or steam containing vessel. This group covers also boilers with fire-tubes being in upright and horizontal arrangement.

Relationships with other classification places

The following types of steam boilers are covered by the following classification schemes:

- Steam boilers of drum type are classified in [F22B 5/00](#).
- Steam boilers of furnace-tube type are classified in [F22B 7/00](#).
- Steam boilers of fire-tube type are classified in [F22B 9/00](#).
- Steam boilers of fire box type are classified in [F22B 13/00](#).

Steam boilers of fire-box type, i.e. the combustion of fuel being performed in a chamber or fire-box with subsequent flue(s) or fire tube(s), both chamber or fire-box and flues or fire tubes being built-in in the boiler body

Definition statement

This place covers:

Boilers in which combustion of fuel is performed inside a chamber called fire box and fire tubes of flues being attached to the wall of the fire-box and carry the hot gaseous products of combustion through the boiler water, heating it, before they escape to the atmosphere. Both, the fire-box and fire-tubes are built-in in the boiler body. This group covers locomotive boilers, fire-box boiler with flues other than fire-tubes and component parts of said boilers.

Relationships with other classification places

The following types of steam boilers are covered by the following classification schemes:

- Steam boilers of drum type are classified in [F22B 5/00](#).
- Steam boilers of furnace-tube type are classified in [F22B 7/00](#)

Instantaneous or flash steam boilers

Definition statement

This place covers:

All steam generators and steam generation methods with an instant steam generation process including flash steam boilers. The group covers instantaneous steam boilers built up from fire tubes, from water tubes, from rotary heat-exchange elements or from heat-exchange elements arranged within a confined chamber having heat retaining walls and steam boilers with spray nozzles for sprinkling or injecting water particles on to or into hot heat-exchange elements.

Steam boilers of forced-flow type

Definition statement

This place covers:

Steam boilers in which means are provided, such a pump in order to ensure the flow of the working medium. The group covers details, component parts and arrangements of steam boilers of forced circulation type, steam boilers of combination type in which natural flow (convection circulation) is promoted by additional measures and boilers of once through type in which flow is forced (forced once through boilers).

Relationships with other classification places

Water tube boilers of horizontal type ([F22B 15/00](#)) are normally steam boilers of forced flow type and Water tube boilers of vertical type ([F22B 21/00](#)) are normally boilers of natural convection type.

Special rules of classification

In subgroup [F22B 29/06](#) steam boilers of once through type are classified. Even it is not explicitly mentioned said subgroup covers forced once through boilers.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Once through boiler	type of boiler, in which water is input at one side, and steam is extracted from the other side of the flow path
Forced flow boiler	type of boiler, in which a pump ensures flow
Forced once through boiler	combination of a once through and a forced flow boiler (a pump ensures flow of a boiler in which water is input at one side, and steam is extracted from the other side of the flow path)
Forced circulation boiler	the circulation is achieved by a circulation pump
Natural circulation boiler	the circulation is achieved by the difference in density of the heated water in the boiler causing convection currents

F22B 31/00

Modifications of boiler construction, or of tube systems, dependent on installation of combustion apparatus; Arrangements of dispositions of combustion apparatus (steam generation characterised by heating method [F22B 1/00](#); combustion apparatus per se [F23](#))

Definition statement

This place covers:

Modifications of boiler construction or of tube systems dependent on the installation of combustion apparatus like

- boilers with combustion in a fluidized bed (boilers of water tube type, constructional features of bed cooling, control systems thereof, details concerning the recirculation of the fluidized bed particles)
- installation of water tube boilers in chimneys
- heat supply by installation of two or more combustion apparatus and
- installations of heat exchangers in boilers for heating air supplied for combustion

Relationships with other classification places

Chemical or physical processes in general, conducted in the presence of fluids and solid particles and apparatus for such processes are covered by [B01J 8/00](#). Fluidized bed combustion apparatus per se are covered by group [F23C 10/00](#) and fluidised bed furnaces by group [F27B 15/00](#).

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

FBC	Fluidized Bed Combustion
PFBC	Pressurised Fluidized Bed Combustion
APFBC	Advanced Pressurised Fluidized Bed Combustion
GFBC	Gasification Fluidized Bed Combustion Combined cycle systems
CHIPPS	Combustion-based High Performance Power System

F22B 33/00

Steam-generation plants, e.g. comprising steam boilers of different types in mutual association (arrangements or dispositions of steam-generation plants in marine vessels [B63H 21/00](#))

Definition statement

This place covers:

Steam generation plants in the meaning of devices for the generation of steam with other apparatus in mutual association with the steam boilers. Steam boilers of different types in mutual association having a single combustion apparatus in common, like combinations

- of boilers of furnace tube type with boilers of water tube type
- of boilers of furnace tube type with boilers of fire tube type
- of boilers of water tube type with boilers of fire tube type
- of two or more superposed boilers,

self contained boilers comprising as a unit the steam boiler, the combustor and fuel storage accessory machines,

combinations of low and high pressure boilers and

combinations of steam boilers with other apparatus, like a condenser, a chemical reactor or other are also covered.

Relationships with other classification places

Steam engine plants related to the thermodynamic cycle and focussed in power generation are classified in [F01K](#).

The following types of steam boilers are covered by the following classification schemes:

- Steam boilers of drum type are classified in [F22B 5/00](#).
- Steam boilers of furnace-tube type are classified in [F22B 7/00](#).
- Steam boilers of fire tube type are classified in [F22B 9/00](#).
- Steam boilers of combined fire-tube type and water-tube type are classified in [F22B 11/00](#).

Relationships with other classification places

- Steam boilers of fire box type are classified in [F22B 13/00](#).
- Steam boilers of water-tube type are classified in [F22B 15/00](#), [F22B 17/00](#), [F22B 19/00](#) and [F22B 23/00](#).

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Steam boilers of fire box type with combinations of low and high pressure locomotive boilers	F22B 13/065
Arrangements or dispositions of steam-generation plants in marine vessels	B63H 21/00
Steam engine plants having separately fired heaters delivering steam to a common mains	F01K 3/242
Steam engine plants having separately fired heaters delivering steam at different pressure levels	F01K 3/245

Special rules of classification

Documents which contain a boiler of combined water tube and fire tube type should be classified in [F22B 11/00](#). Subgroup [F22B 33/08](#) covers steam generation plants comprising several boilers having a single combustion apparatus in common where at least one boiler is a boiler of water tube type and at least an other is a boiler of fire tube type.

F22B 35/00

Control systems for steam boilers (for fluidized bed boilers [F22B 31/0076](#);} regulation or control of steam power plants [F01K 7/00](#); for regulating feed-water supply [F22D](#); for controlling superheat temperature [F22G 5/00](#); control of combustion [F23N](#); regulating or controlling in general [G05](#))

Definition statement

This place covers:

Control system of steam boilers in general like control by flue gas dampers, control by recirculating flue gases, control systems for steam generators of nuclear power plants, control systems for instantaneous steam boilers, control systems for waste heat boilers, control systems for two or more steam generators, control systems for steam boilers with natural convection circulation and control systems for steam boilers of forced flow type.

Relationships with other classification places

Documents related to control of nuclear power plants are classified in [G21D 3/00](#), to control of nuclear reaction in [G21C 7/00](#), control of steam engine plants in [F01K 13/02](#), to control of feed water heaters in [F22D 5/00](#) and control of superheat temperature in [F22G 5/00](#).

Control superheat temperature by indirectly cooling or heating the superheated steam in auxiliary enclosed heat exchanger	F22G 5/16
Control of combustion	F23N
Control of steam power plants	G05

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Once through boiler	type of boiler, in which water is input at one side, and steam is extracted from the other side of the flow path
Forced flow boiler	Type of boiler, in which a pump ensures flow
Forced once through boiler	combination of a once through and a forced flow boiler (a pump ensures flow of a boiler in which water is input at one side, and steam is extracted from the other side of the flow path)
Forced circulation boiler	the circulation is achieved by a circulation pump
Natural circulation boiler	the circulation is achieved by the difference in density of the heated water in the boiler causing convection currents

F22B 37/00

Component parts or details of steam boilers (venting devices [F16K 24/00](#); steam traps or like apparatus [F16T](#))

Definition statement

This place covers:

Component parts or details of steam boilers categorised in three groups:

- of steam generators built up from pre fabricated elements
- of nuclear steam generators including maintenance or repairing
- applicable to more than one kind of steam boiler
- specially adapted for steam boilers of instantaneous or flash type
- specially adapted for steam boilers of forced flow type
- adaptations or mounting of devices for observing existence or direction of fluid flow
- adaptations or mounting of level indicators

The group, which is applicable to more than one kind of steam boiler and which could be applied also to nuclear steam boilers, steam boilers of pre fabricated elements, instantaneous type boilers and forced flow type boilers, covers:

- steam boilers characterised by material

Definition statement

- accessories of flue or fire tubes
- accessories of water tubes
- accessories of drums or headers
- arrangements for supporting, suspending or setting
- steam separating arrangements
- adaptation of boilers for promoting water circulation
- arrangements for sheathing or casing boilers
- devices and methods for determining or indicating operation conditions
- arrangements of partition walls in flues of steam boilers
- applications of alarm or automatic safety devices
- devices and methods for removing water, salt or sludge
- boiler cleaning control devices
- methods and tools for removing tubes from headers or drums

Relationships with other classification places

Working or processing of sheet metal or metal tubes are classified in [B21D](#), pipes, joints and fittings for pipes in [F16L](#) and cleaning of internal or external surfaces of heat exchangers in [F28D](#).
