G09G ARRANGEMENTS OR CIRCUITS FOR CONTROL OF INDICATING DEVICES USING STATIC MEANS TO PRESENT VARIABLE INFORMATION (arrangements

for transferring data between digital computers and displays <u>G06F 3/14</u>; static indicating arrangements comprising an association of a number of separate sources or light control cells <u>G09F 9/00</u>; static indicating arrangements comprising integral associations of a number of light sources <u>H01J</u>, <u>H01K</u>, <u>H01L</u>, <u>H05B 33/12</u>; scanning, transmission or reproduction of documents or the like, e.g. facsimile transmission, details thereof H04N 1/00)

NOTES

- 1. This subclass <u>covers</u> indicator consoles, i.e. arrangements or circuits for processing control signals to achieve the display, e.g. for the calling up, reception, storage, regeneration, coding, decoding, addressing of control signals.
- 2. This subclass <u>does not cover</u> the structural details of the indicating devices, such as panels or tubes <u>per se</u>, or assemblies of individual light sources, which are covered by the relevant subclasses, e.g. <u>H01J</u>, <u>H01K</u>, <u>H01L</u>, <u>H10K</u>, <u>G02F</u>, <u>G09F</u>, <u>H05B</u>.
- 3. Contrary to subclass <u>H04N</u>, in which are classified display devices capable of representing continuous brightness value scales, this subclass is limited to devices using only a discrete number of brightness values, e.g. visible/non-visible.
- 4. The visual effect may be produced by a luminescent screen scanned by an electron beam, directly by controlled light sources, by projection of light, from controlled light sources onto characters, symbols, or elements thereof drawn on a support, or by electric, magnetic, or acoustic control of the parameters of light rays from an independent source.

WARNING

In this subclass non-limiting references (in the sense of paragraph 39 of the Guide to the IPC) may still be displayed in the scheme.

Horizontal resolution change . Gradation resolution change . Change or adaptation of the frame rate of the video stream	2360/04 2360/06 2360/08 2360/10 2360/12 2360/121 2360/123 2360/125 2360/126 2360/127 2360/128 2360/14	 e.g. input or output formats Display device controller operating with a plurality of display units Use of more than one graphics processor to process data before displaying to one or more screens Power processing, i.e. workload management for processors involved in display operations, such as CPUs or GPUs Display system comprising arrangements, such as a coprocessor, specific for motion video images Frame memory handling using a cache memory Tiling using unified memory architecture [UMA] The frame memory having additional data ports, not inclusive of standard details of the output serial port of a VRAM Updating a frame memory using a transfer of data from a source area to a destination area Frame memory using a Synchronous Dynamic RAM [SDRAM] Detecting light within display terminals, e.g. using a single or a plurality of photosensors the light conveying information used for selecting or modulating the light emitting or modulating
2330/027 2330/028 2330/04 2330/045 2330/06 2330/08 2330/10 2330/12 2340/00 2340/02 2340/04 2340/0407 2340/0414 2340/0421 2340/0428 2340/0435	display Arrangements or methods related to powering off a display Generation of voltages supplied to electrode drivers in a matrix display other than LCD Display protection Protection against panel overheating Handling electromagnetic interferences [EMI], covering emitted as well as received electromagnetic radiation Fault-tolerant or redundant circuits, or circuits in which repair of defects is prepared Dealing with defective pixels Test circuits or failure detection circuits included in a display system, as permanent part thereof Aspects of display data processing Handling of images in compressed format, e.g. JPEG, MPEG Changes in size, position or resolution of an image Resolution change, inclusive of the use of different resolutions for different screen areas Vertical resolution change Horizontal resolution change Change or adaptation of the frame rate of the video stream	2360/04 2360/06 2360/08 2360/10 2360/12 2360/121 2360/122 2360/125 2360/125 2360/127 2360/128 2360/14 2360/141	 e.g. input or output formats Display device controller operating with a plurality of display units Use of more than one graphics processor to process data before displaying to one or more screens Power processing, i.e. workload management for processors involved in display operations, such as CPUs or GPUs Display system comprising arrangements, such as a coprocessor, specific for motion video images Frame memory handling using a cache memory Tiling using unified memory architecture [UMA] The frame memory having additional data ports, not inclusive of standard details of the output serial port of a VRAM Updating a frame memory using a transfer of data from a source area to a destination area Frame memory using a Synchronous Dynamic RAM [SDRAM] Detecting light within display terminals, e.g. using a single or a plurality of photosensors the light conveying information used for selecting or modulating the light emitting or modulating element
2330/027 2330/028 2330/04 2330/045 2330/06 2330/08 2330/10 2330/12 2340/00 2340/02 2340/04 2340/0407 2340/0414 2340/0421 2340/0428 2340/0435	display Arrangements or methods related to powering off a display Generation of voltages supplied to electrode drivers in a matrix display other than LCD Display protection Protection against panel overheating Handling electromagnetic interferences [EMI], covering emitted as well as received electromagnetic radiation Fault-tolerant or redundant circuits, or circuits in which repair of defects is prepared Dealing with defective pixels Test circuits or failure detection circuits included in a display system, as permanent part thereof Aspects of display data processing Handling of images in compressed format, e.g. JPEG, MPEG Changes in size, position or resolution of an image Resolution change, inclusive of the use of different resolutions for different screen areas Vertical resolution change Gradation resolution change Gradation resolution change Change or adaptation of the frame rate of the video stream Handling or displaying different aspect ratios, or	2360/04 2360/06 2360/08 2360/10 2360/12 2360/121 2360/123 2360/125 2360/126 2360/127 2360/128 2360/14	 e.g. input or output formats Display device controller operating with a plurality of display units Use of more than one graphics processor to process data before displaying to one or more screens Power processing, i.e. workload management for processors involved in display operations, such as CPUs or GPUs Display system comprising arrangements, such as a coprocessor, specific for motion video images Frame memory handling using a cache memory Tiling using unified memory architecture [UMA] The frame memory having additional data ports, not inclusive of standard details of the output serial port of a VRAM Updating a frame memory using a transfer of data from a source area to a destination area Frame memory using a Synchronous Dynamic RAM [SDRAM] Detecting light within display terminals, e.g. using a single or a plurality of photosensors the light conveying information used for selecting or modulating the light emitting or modulating element the light being detected by light detection
2330/027 2330/028 2330/04 2330/04 2330/06 2330/08 2330/10 2330/12 2340/00 2340/02 2340/04 2340/0407 2340/0414 2340/0421 2340/0428 2340/0435	display Arrangements or methods related to powering off a display Generation of voltages supplied to electrode drivers in a matrix display other than LCD Display protection Protection against panel overheating Handling electromagnetic interferences [EMI], covering emitted as well as received electromagnetic radiation Fault-tolerant or redundant circuits, or circuits in which repair of defects is prepared Dealing with defective pixels Test circuits or failure detection circuits included in a display system, as permanent part thereof Aspects of display data processing Handling of images in compressed format, e.g. JPEG, MPEG Changes in size, position or resolution of an image Resolution change, inclusive of the use of different resolutions for different screen areas Period of the use of different resolution change Change or adaptation change Change or adaptation of the frame rate of the video stream Handling or displaying different aspect ratios, or changing the aspect ratio	2360/04 2360/06 2360/08 2360/10 2360/12 2360/121 2360/122 2360/125 2360/125 2360/127 2360/128 2360/14 2360/141	 e.g. input or output formats Display device controller operating with a plurality of display units Use of more than one graphics processor to process data before displaying to one or more screens Power processing, i.e. workload management for processors involved in display operations, such as CPUs or GPUs Display system comprising arrangements, such as a coprocessor, specific for motion video images Frame memory handling using a cache memory Tiling using unified memory architecture [UMA] The frame memory having additional data ports, not inclusive of standard details of the output serial port of a VRAM Updating a frame memory using a transfer of data from a source area to a destination area Frame memory using a Synchronous Dynamic RAM [SDRAM] Detecting light within display terminals, e.g. using a single or a plurality of photosensors the light conveying information used for selecting or modulating the light emitting or modulating element

2260/145	dha liabh aniain din a fuann dha dianlan ann an
2360/145	the light originating from the display screen
2360/147	• • • the originated light output being determined for each pixel
2360/148	• • • • the light being detected by light detection means within each pixel
2360/16	Calculation or use of calculated indices related to
2300/10	luminance levels in display data
2360/18	Use of a frame buffer in a display terminal,
2300/10	inclusive of the display panel
2370/00	Aspects of data communication
2370/02	Networking aspects
2370/022	Centralised management of display operation, e.g.
	in a server instead of locally
2370/025	LAN communication management
2370/027	Arrangements and methods specific for the
	display of internet documents
2370/04	Exchange of auxiliary data, i.e. other than image
	data, between monitor and graphics controller
2370/042	for monitor identification
2370/045	using multiple communication channels, e.g. parallel and serial
2370/047	using display data channel standard [DDC] communication
2370/06	Consumer Electronics Control, i.e. control of
2370/00	another device by a display or <u>vice versa</u>
2370/08	Details of image data interface between the display
	device controller and the data line driver circuit
2370/10	• Use of a protocol of communication by packets in
	interfaces along the display data pipeline
2370/12	. Use of DVI or HDMI protocol in interfaces along
	the display data pipeline
2370/14	• Use of low voltage differential signaling [LVDS]
	for display data communication
2370/16	• Use of wireless transmission of display information
2370/18	• Use of optical transmission of display information
2370/20	• Details of the management of multiple sources of
	image data
2370/22	Detection of presence or absence of input display
	information or of connection or disconnection of a
2270/24	corresponding information source
2370/24	. Keyboard-Video-Mouse [KVM] switch
2380/00	Specific applications
2380/02	Flexible displays
2380/04	Electronic labels
2380/06	Remotely controlled electronic signs other than
	labels
2380/08	Biomedical applications
2380/10	Automotive applications
2380/12	Avionics applications
2380/14	Electronic books and readers
2380/16	Digital picture frames
