In today's world, innovation and invention are essential. So many jobs will be taken over by technology, new ones need to be produced by new inventions, etc. The Patent process MUST encourage individuals to invent and innovate and have them feel they will be looked after and protected, not just by big companies.

Regulations must provide predictability. Stakeholders must be able to know in advance whether a petition is to be permitted or denied for policy reasons. To this end, regulations should favor objective analysis and eschew subjectivity, balancing, weighing, holistic viewing, and individual discretion. The decision-making should be procedural, based on clear rules. Presence or absence of discrete factors should be determinative, at least in ordinary circumstances. If compounded or weighted factors are absolutely necessary, the number of possible combinations must be minimized and the rubric must be published in the Code of Federal Regulations.
