Subject: Patent for AI
Date: Thursday, September 19, 2019 4:21:54 AM

I want a patent for when some input generates some output with computer tweeking all insides

.

Yes please all the deep or shallow neural networks.

are you really letting patent the undefined matrix implementation of nodes?

DO NOT DARE TO PATENT UNIDENTIFIED random lucky configuration for DEVICE GENERATED SOFTWARE.

anything that is not specific and randomly generated can not be patented

No automatically generated system shall be considered invention patentable by the person/company/entity, since they didnt do a S*ht to make that happen.

having big pc running long enough to generate matrix of values to have ioutput generated from input.

"car takes gasoline as input and generates fumes as output."

AI specificity should mention exact amount of configuration that person/company/entity does.

anything that comes out of automatic/ non human generated shall be patented to non human which generated it.
