

Dear Sirs,

Please, kindly find below 2 (two) patent quality-related topics that I believe should be a subject of a case study. I think, this would help USPTO employees to better the quality of their services and to take action in improving the quality of the patent registration process. By the way, my ex-husband (100K) built USPTO buildings in Arlington and I used to live across the street from them. Nice area!

1.

Title: "Wider choice of file extensions for receipt of electronically submitted patents' drawings, sketches and plans."

Proposal for study: "Research and implementation of reception of electronically submitted drawings, sketches and plans as multiple extensions files using Adobe Illustrator, AutoCAD, Archicad, Google SketchUP (language: Ruby), and other software, that would allow inventors to be more flexible and creative in terms of quick documentation preparation, submission, registration, and invention manufacturing."

Explanation: If I understand it correctly, nowadays USPTO accepts patents' drawings, sketches and plans electronically in different types of formats. I suggest that the choice of file extensions potentially should be broadened. As a result, in my opinion, this would speed up the paperwork submission process and save clientele's time in file conversion. In conclusion, this would give an opportunity to the researchers to further develop their skills in learning new software, would serve as an example in training of new customers, and would stimulate further interest in the field of intellectual property law.

2.

Title: "Possibility/opportunity/chance of reregistration of inventions with improvements and minor changes and prompt reporting."

Proposal for study: "Monthly infographic life-cycle and history reporting on reregistered inventions with improvements and minor changes: manufacturing, distribution, and sales."

Explanation: To my mind, there should be an accurate and systemized monthly infographic life-cycle and history reporting system for reregistered inventions with improvements and minor changes in place, similar to the project management - from start to finish. Moreover, there should be an opportunity for crowd writing feedback, ghostwriting FAQs, and social networks collaboration. Finally, there should be an option for clients to group, sort, and manipulate data to achieve a narrower and more precise query results.

Sincerely,

Olga
