Subject: MRF - Comments

I don't believe there can be consistency in comments now. But as the data base collects data the growth potential towards consistent review comments will give way to consistency. In time, utilizing present data points and comments that allow for key word searches, then the review form will be a master.

The review form being new, should be anticipated by the reviewers as a mandatory aide/questionnaire that everyone must participate oin even if the comments are not used or do not appear useful presently, but gives way to an eventual thought process. Eventually when reviewers see inventions that are innovative for the time they can search past comments of key words that will assist them with that future initiative.

I believe also that the computer - functioning as a hard-human - should be used, even in the initial form process as a reviewer allowing the soft-human (you and I) to input and be flexible in our processing of the invention.

Thanks, and
Best regards,

Pia Jerome
