C08B

POLYSACCHARIDES; DERIVATIVES THEREOF (polysaccharides containing less than six saccharide radicals attached to each other by glycosidic linkages C07H; fermentation or enzyme-using processes C12P 19/00; sugar industry C13; production of cellulose D21)

Definition statement

This place covers:
- Polysaccharides per se or their derivatives, with six or more repeating units, i.e. saccharide radicals attached to each other by glycosidic linkages.
- Processes of extraction, preparation, derivatisation, fractionation, isolation, purification or degradation.
- Covalently or ionically crosslinked gels of polysaccharides.

Relationships with other classification places

Relationship with other subclasses C08 and C09

Macromolecular compounds obtained by reactions only involving carbon-to-carbon unsaturated bonds, i.e. addition polymers, are classified in subclass C08F.

Macromolecular compounds obtained otherwise than by reactions only involving carbon-to-carbon unsaturated bonds, e.g. condensation polymers, are classified in subclass C08G.

Derivatives of natural macromolecular polymers, e.g. derived from proteins, lignin, ligno-cellulosic materials or vulcanised oils, are classified in subclass C08H.

Working-up, general processes of compounding and after-treatment of macromolecular compounds are classified in subclass C08J, including in particular the making of hydrogels is classified in C08J 3/075.

The use or choice of inorganic or non-macromolecular organic materials as compounding agents are classified in subclass C08K.

Polysaccharides or derivatives thereof in solution, or together with other macromolecular compounds, or together with an inorganic or non-macromolecular organic additive are considered as a composition and are thus classified according to the rules of C08L.

Coating compositions based on macromolecular compounds and other polymer compositions for similar uses, e.g. paints, inks, woodstains and printing pastes, are classified in subclass C09D.

Adhesives or binders based on macromolecular compounds, as well as adhesive processes, are classified in subclass C09J.

Special rules of classification

- The subject-matter disclosed in both the claims and the examples of a patent document is to be classified.
- In case of doubt, it is recommended to classify as much data as possible.
- Compositions containing a polysaccharide and an inorganic or non-macromolecular organic additive as compounding agent are not classified in \( \text{C08K} \) contrary to what is indicated in the rules for \( \text{C08L} \) or \( \text{C08K} \), but in the corresponding \( \text{C08L} \) subclass together with the corresponding Indexing Code(s) in \( \text{C08K} \).

Covalently or ionically crosslinked gels containing a polysaccharide are classified in the corresponding \( \text{C08B} \) as they are considered as polysaccharide derivatives per se.

Ex. Hydrogel of alginate are classified in \( \text{C08L 5/04}, \text{C08J 3/075} \) and \( \text{C08J 2305/04} \).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saccharide radical</td>
<td>Saccharide radicals are monosaccharide repeating units.</td>
</tr>
</tbody>
</table>
A glycosidic bond is a type of covalent bond that joins a carbohydrate molecule to another group, which may or may not be another carbohydrate. A glycosidic bond is formed between the hemiacetal group of a saccharide (or a molecule derived from a saccharide) and the hydroxyl group of some organic compound. If the group attached to the carbohydrate residue is not another saccharide it is referred to as an aglycone. If it is another saccharide, the resulting units can be termed as being at the reducing end or the terminal end of the structure. The reducing end of the di- or polysaccharide is towards the last anomic carbon of the structure, and the terminal end is in the opposite direction. One distinguishes between α- and β-glycosidic bonds based on the relative stereochemistry of the anomic position and the stereocentre furthest from C1 in the saccharide. In D-hexose sugars in their pyranose forms, an α-glycosidic bond is formed in an axial orientation, whereas a β-glycosidic bond will be oriented equatorially.

C08B 1/00
Preparatory treatment of cellulose for making derivatives thereof {, e.g. pre-treatment, pre-soaking, activation}

Definition statement
This place covers:
The preparation of cellulose solutions, i.e. dopes, with different possible solvents, e.g. the preparation of cuprammonium cellulose solutions
The preparation of cellulose suitable for esterification or etherification, e.g. preparation of cellulose nitrate
Alkali cellulose and the apparatus therefor

C08B 3/00
Preparation of cellulose esters of organic acids { (rendering cellulose suitable for esterification C08B 1/02) }

Definition statement
This place covers:
The preparation of cellulose esters of organic acid, e.g. cellulose formate, cellulose acetate, mixed organic cellulose esters.
The catalysts used for the esterification.
The esterification with maintenance of the fibrous structure of the cellulose.
Post-esterification treatments.
**C08B 5/00**

**Preparation of cellulose esters of inorganic acids**, e.g. phosphates (rendering cellulose suitable for esterification **C08B 1/02**)

**Definition statement**

*This place covers:*

The preparation of cellulose esters of inorganic acids, e.g. cellulose nitrate, i.e. nitrocellulose.

Post-esterification treatments.

**C08B 7/00**

**Preparation of cellulose esters of both organic and inorganic acids** (rendering cellulose suitable for esterification **C08B 1/02**)

**Definition statement**

*This place covers:*

Mixed cellulose esters wherein residues of organic and inorganic acids are simultaneously present.

**C08B 9/00**

**Cellulose xanthate; Viscose** (formation of films **C08J 5/18**; formation of fibres **D01F**; rendering cellulose suitable for esterification **C08B 1/02**)

**Definition statement**

*This place covers:*

Cellulose xanthate.

Viscose.

Their process of preparation.

**Glossary of terms**

*In this place, the following terms or expressions are used with the meaning indicated:*

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Viscose</td>
<td>A solution of cellulose xanthate made by treating a cellulose compound with sodium hydroxide and carbon disulfide</td>
</tr>
</tbody>
</table>

**C08B 11/00**

**Preparation of cellulose ethers** (rendering cellulose suitable for etherification **C08B 1/06**)

**Definition statement**

*This place covers:*

The preparation of cellulose ethers, e.g. alkyl or cycloalkyl ethers, aryl or aralkyl ethers or mixed ethers.

Post-etherification treatments of chemical or physical type, e.g. purification or isolation.
**C08B 13/00**

**Preparation of cellulose ether-esters**

**Definition statement**
*This place covers:*
e.g. preparation of cellulose ether xanthates.
The preparation of cellulose derivatives comprising simultaneously ether and ester substituents

**C08B 15/00**

**Preparation of other cellulose derivatives or modified cellulose, e.g. complexes**

**Definition statement**
*This place covers:*
Preparation of oxy-cellulose, hydrocellulose, cellulosehydrate or carboxycellulose.
Crosslinking of cellulose or cellulose derivatives.

**C08B 16/00**

**Regeneration of cellulose**

**Definition statement**
*This place covers:*
Methods for regenerating cellulose, e.g. from solution.
Regenerated cellulose as such.

**C08B 17/00**

**Apparatus for esterification or etherification of cellulose**

**Definition statement**
*This place covers:*
Apparatus and equipment for the preparation of cellulose ethers or cellulose esters, e.g. reactors, mixing devices, tubing, feeders, etc.

**C08B 30/00**

**Preparation of starch, degraded or non-chemically modified starch, amylose, or amylpectin**

**Definition statement**
*This place covers:*
The extraction or purification of starch, amylose and amylpectin from raw materials.
The working-up of residues of starch extraction.
The degradation of starch and its products (e.g. dextrin, cold water dispersible starch).
The modification of starch by non-chemical means (i.e., mechanical, enzymatic, by irradiation)

**C08B 31/00**

Preparation of derivatives of starch (derivatives of amylose [**C08B 33/00**]; derivatives of amylopectin [**C08B 35/00**])

**Definition statement**

*This place covers:*

The preparation of starch ethers, starch esters, ether-ester.

The crosslinking of starch and starch derivatives.

Oxidation of starch and oxidised starch.

**C08B 33/00**

Preparation of derivatives of amylose

**Definition statement**

*This place covers:*

The preparation of amylose ethers, amylose esters, ether-ester.

Oxidised amylose.

**C08B 35/00**

Preparation of derivatives of amylopectin

**Definition statement**

*This place covers:*

The preparation of amylopectin ethers, amylopectin esters, ether-ester.

Oxidised amylopectin.

**C08B 37/00**

Preparation of polysaccharides not provided for in groups [**C08B 1/00** - **C08B 35/00**]; Derivatives thereof (cellulose [**D21**]; {microbiological processes [**C12P**]})

**Definition statement**

*This place covers:*

Extraction, preparation, derivatisation or degradation of polysaccharides per se, including homopolysaccharides ([**C08B 37/0006**]) and heteropolysaccharides ([**C08B 37/006**]), possibly combined with the extraction / fractionation / isolation / purification of said polysaccharides ([**C08B 37/0003**]).

**Relationships with other classification places**

**Multiple classification**

Polyrotaxanes, e.g. inclusion compounds are classified in [**C08G 83/007**].

Medicinal preparations characterised by the non-active ingredient, e.g. inclusion compounds with cyclodextrins are classified in [**A61K 47/6951**].
