G02B

OPTICAL ELEMENTS, SYSTEMS, OR APPARATUS (G02F takes precedence; measuring-instruments, see the relevant subclass of G01, e.g. optical rangefinders G01C; testing of optical elements, systems, or apparatus G01M 11/00; spectacles G02C; sound lenses G10K 11/30; electron and ion "optics" H01J; X-ray "optics" H01J, H05G 1/00; optical elements structurally combined with electric discharge tubes H01J 5/16, H01J 29/89, H01J 37/22; microwave "optics" H01Q; combination of optical elements with television receivers H04N 5/72; heating arrangements specially adapted for transparent or reflecting areas H05B 3/84; {optical apparatus 42H})

Definition statement

This place covers:

Passive optical elements and systems, i.e. elements and systems which are not based on the optical properties of the material used being altered by the application of an external field.

In particular:

• Optical elements characterised by the material of which they are made
• Simple or compound lenses
• Optical elements other than lenses (e.g. prisms, diffusers, mirrors, diffraction gratings, filters, polarisers)
• Light guides; Structural details of arrangements comprising light guides and other optical elements, e.g. couplings (Note: to be dealt with in a further FCR document relating to G02B 6/00)
• Mountings, adjusting means, or light-tight connections, for optical elements
• Optical objectives or lens systems characterised both by the number of the optical components and their arrangements according to their sign, i.e. + or -
• Optical objectives specially designed for specific purposes
• Optical objectives with means for varying the magnification, e.g. zoom lenses
• Systems with reflecting surfaces, with or without refracting elements, i.e. catadioptric or catoptric systems
• Optical condensers
• Microscopes
• Telescopes, e.g. binoculars; Periscopes; Instruments for viewing the inside of hollow bodies
• Eyepieces (e.g. for telescopes, microscopes); Magnifying glasses
• Optical devices or arrangements using movable or deformable optical elements

Relationships with other classification places

Whereas G02B relates to passive optics, "active" optics, i.e. where the optical properties of the material used in the optical device are altered by the application of an external field (e.g. electro-optical devices, magneto-optical devices, LCDs) is covered by G02F.

Special rules of classification

- The IPC groups G02B11/00 - G02B11/34 are not used for classification of incoming documents in ECLA, the subject-matter is covered by G02B 9/00 and subgroups and G02B 13/00 and subgroups.
- Other IPC classes which are not used for classification are:
  - G02B 7/185 - G02B 7/198 (subject-matter covered by G02B 7/182 and subgroups),
  - G02B 27/18 (subject-matter covered in H04N and G03B), and
  - G02B 27/24 (subject-matter covered by G02B 27/22 and subgroups).

Indexing Codes in general:

Classification of additional information is mandatory. Assessment is done however on a case by case basis, e.g., a document describing the detailed structure of a wire grid polarizer should be classified in G02B 5/3058, whereas a document describing a display system making explicit use of a wire grid polarizer without providing structural details of the polarizer itself should be given in G02B 5/3058 as an additional invention symbol.

Indexing Codes special cases (outside of the reformed ECLA structure, the following additional sets of Indexing Codes are used):
- The set of Indexing Codes G02B 2207/00 - G02B 2207/129 provide classification entries for "orthogonal" features, i.e., features which may arise in the field in general.
- The set of Indexing Codes under G02B 27/01 provide classification entries to cover further details of subject matter covered by G02B 27/01 and not provided for in its subgroups.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

| Mirror | device for which the essential characteristic is maximum reflectivity over a given spectral range. A reflecting layer in a mirror is defined as a layer adapted to play a role in the reflection of light, and thus it does not refer to other layers having essentially no reflective function, e.g. protective layers |
| Filter | device for which the essential characteristic is spectral selectivity, i.e. not only the spectral range passed (for example, by transmission, reflection) but also the spectral range rejected (for example, by absorption, transmission, reflection) |

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

FSS frequency selective surface

G02B 5/04

Prisms

Definition statement

This place covers:
Optical elements being prisms
G02B 5/08
Mirrors {(vehicle mirrors involving special optical features B60R 1/08)}

Definition statement

G02B 5/204
{in which spectral selection is performed by means of a conductive grid or array, e.g. frequency selective surfaces (for use with wavelengths longer than the infra-red light H01Q 15/0006)}

Definition statement
This place covers:
Filters in which the spectral filtering is performed by a conductive grid or mesh. The background is that for microwave optics, there has long existed a technique in which a conductive periodic pattern (a so-called "frequency selective surface" or FSS) is used to select a particular set of frequencies. For microwaves they are found in the subgroup H01Q 15/0006. In recent years this technique has been extended to IR and even visible wavelengths. It is these types of filters (and only these) which should go into G02B 5/204. Basically they look something like this:

<td>Frequency filtering for aerials</td>
<td></td>
</tr>
</tbody>
</table>

**Special rules of classification**

**G02B 5/204** is not to be used for classifying normal spectral filters which just happen to have some additional conducting elements for other purposes not to do with spectral selection. In particular it is not for filters having a conductive EM shielding layer or a conductive louvre light blocking grid attached. For such arrangements, the following places may be appropriate:

- **G02B 2207/121** - Antistatic or EM shielding layer
- **G02B 2207/123** - Optical louvre elements, e.g. for directional light blocking
- **G02B 1/116** - Multilayer inorganic AR coatings having a conducting layer light **F21V**

**G02B 5/28**

G02B 6/00

Light guides

Definition statement

This place covers:

Light guides per se, coupling light guides and mechanical protection of light guides.

The term "light" as used in G02B 6/00 refers to visible, infrared and ultraviolet light only.

The group covers the optical and mechanical aspects of light guides and light guide coupling, including the coupling of light into, out of and between light guides, as well as positioning, holding and protecting the light guides. This includes optical cables and arrangements for handling optical cables. The group covers the manufacture of some light guides, in particular optical waveguides of the integrated circuit kind.

The group covers light guides for illumination.

Light guides occur in many areas of technology. To avoid unnecessary double classification, the implementation of light guides in optical systems and instruments for which specific entries exist elsewhere (for example in surgical instruments or for chemical sensing) are not generally given a secondary class in G02B 6/00. This applies particularly to systems and instruments where light guide use is well established. The brief mention of a light guide does not in itself justify classifying in G02B 6/00. Exceptionally, where an optical aspect of the light guide coupling of general interest is disclosed, such a secondary class may be given. A class in G02B 6/00 is always given where a passive light guide per se has been specially adapted.

Relationships with other classification places

"Active" optics, i.e. where the optical property of the light guide or of an optical element coupled to the light guide is altered by the application of an external field are classified in G02F.

Backlights characterised by the light guides for liquid crystal display panels are classified in G02B 6/0001 - G02B 6/0096.

Light amplifying light guides are classified in H01S.

Systems for communication are classified in H04, in particular optical transmission systems in general are classified in H04B 10/00, optical multiplex systems are classified in H04J 14/00, and optical switching systems are classified in H04Q 11/0001. Network and system aspects are classified in H04 and not in G02B 6/00. Light guide arrangements as components, modules or subsystems of communication systems are classified in G02B 6/00: "in the box" aspects are classified in G02B 6/00. For example modules based on light guides for coupling, splitting, mixing, switching and dispersion compensation are classified in G02B 6/00.

Special rules of classification

The primary protective coating immediately surrounding the cladding of an optical fibre is considered to be a component of an optical fibre and is thus classified in the G02B 6/02 subgroup. Further layers around the optical fibre are considered to form optical cables and are thus classified in G02B 6/44 and subgroups. This definition is also used to decide on the subgroup to be used for classifying a coupling. For example a clamp for an optical fibre is classified in G02B 6/36 whereas a clamp for an optical cable is classified in G02B 6/4471.

The following arrangement is observed for the coupling aspects of the various types of light guides:

| Coupling light guides for illumination            | G02B 6/0001 - G02B 6/0096 |
### Polarisation aspects

The following arrangement is observed in relation to polarisation aspects of light guides and light guide couplings

| Polarisation maintaining optical fibres | G02B 6/024 |
| Polarisation issues within light guides per se, including optical fibres and planar waveguides (not polarisation maintaining optical fibres) | G02B 6/105 |
| Polarisation manipulation by planar waveguide coupling | G02B 6/126 |
| Polarisation manipulation by optical fibre coupling | G02B 6/27 - G02B 6/2793 |
| Polarisation manipulating elements between light guides and optoelectronic elements | G02B 6/4215, G02B 6/4246 |

### Wavelength selective aspects

The following arrangement is observed in relation to wavelength aspects of light guides and light guide couplings

| Wavelength affecting properties of optical fibres (e.g. performance and mounting of single gratings or filters in optical fibre, dispersion tailoring) | G02B 6/02 - G02B 6/03694, especially G02B 6/02052 - G02B 6/02209 and G02B 6/02214 - G02B 6/02285 |
| Wavelength selective elements (e.g. gratings, filters) in planar waveguides | G02B 6/122 - G02B 6/138, especially G02B 6/124, and G02B 6/12007 - G02B 6/12033 |
| Coupling of planar waveguides for wavelength selection | G02B 6/12007 - G02B 6/12033 |
| Coupling of optical fibres for wavelength selection | G02B 6/293 - G02B 6/29398 |
| Wavelength selective elements between light guides and optoelectronic elements | G02B 6/4215, G02B 6/4246 |

Indexing Codes are used in some subgroups related particularly to coupling aspects to indicate additional details not available for the particular type of light guide, for example G02B 6/293 - G02B 6/29398 are assigned to waveguides of the integrated circuit kind with wavelength selective elements in addition to G02B 6/12007.
The Indexing Codes corresponding to G02B 6/0001 - G02B 6/001 and G02B 6/0096 are in F21V 2200/00.

Indexing Codes with additional detail compared to the subgroups exist in various parts of G02B 6/00, including G02B 6/032, G02B 6/02123, G02B 6/2804, G02B 6/36, G02B 6/4292 and G02B 6/4296.

G02B 2006/0098 is assigned to light guides for scanning in addition to the appropriate invention group which depends on the type of light guide.

An Indexing Code is occasionally given as a tag to the implementation of light guides in optical systems which are not covered by G02B 6/00 for assisting awareness of the existence of the related subclasses.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

| Planar waveguides | waveguides of the integrated circuit kind |

G02B 6/0001

{specially adapted for lighting devices or systems (lighting or signalling on vehicles using light guides B60Q 1/00; lighting devices for vehicle dashboards B60Q 3/10; lighting devices for vehicle interior using light guides B60Q 3/62; lighting devices mounted on the vehicle rear part using light guides F21S 43/235; measuring arrangements having light conducting pointers G01D 13/265; illumination of liquid crystal displays G02F 1/1336; illuminated signs G09F 13/00)}

Definition statement

This place covers:

Aspects of the light guides for illumination per se as well as light coupling aspects.

Relationships with other classification places

G02B 6/0001 and subgroups include backlights comprising light guides for liquid crystal display panels. Other aspects (other than the light guide) of liquid crystal display backlights are classified in G02F 1/1336. Direct backlights not including a light guide are classified in G02F 1/133602.

Special rules of classification

Light guides in the form of long rods for illumination are classified in G02B 6/0005 and subgroups. The Indexing Codes corresponding to G02B 6/0001 - G02B 6/001 and G02B 6/0096 are in F21V 2200/00.

G02B 6/02

Optical fibre with cladding {with or without a coating} (mechanical structures for providing tensile strength and external protection G02B 6/44)

Definition statement

This place covers:

Optical and mechanical properties of optical fibres per se as well as optical fibres with an integral optical element, such as a Bragg grating.

Further details of subgroups

G02B 6/0204

What is considered large or small usually depends on the type of fibre. For example an area of 50 square microns can be considered large for a dispersion compensating fibre (then G02B 6/0209 and G02B 6/0261 should be given) but not large for a non-zero dispersion shifted fibre (i.e. not classified in G02B 6/0204).

G02B 6/02033

Graded multimode plastic optical fibres are classified in G02B 6/0238 not G02B 6/0288. Fibres compensating modal dispersion are usually classified in G02B 6/0288 or G02B 6/02038 as they typically involve a graded index multimode fibre. 1 mm core graded POF is classified in G02B 6/02038.

G02B 6/02214

G02B 6/02214 is for dispersion tailoring only at wavelengths other than around the 1550nm window (e.g. for 850 nm, 1300 nm). G02B 6/02223 is for dispersion tailoring at 1550nm and another wavelength, e.g. 1300 nm, in the same optical fibre.
Illustrative example of the subject matter classified in this group:

[Diagram showing dispersion and wavelength]

**G02B 6/02233**

The preceding image includes references to G02B 6/02214, G02B 6/02219, G02B 6/02276, G02B 6/02223, G02B 6/02266, G02B 6/02276, G02B 6/02252.

[Diagram showing flat region and wavelength]

(Source WO9733188).
G02B 6/02247

Illustrative example of the subject matter classified in this group:

(Source WO9942869).

G02B 6/028

Graded multimode plastic optical fibres are classified in G02B 6/02038 not G02B 6/028. Fibres compensating modal dispersion are usually classified in G02B 6/0288 or G02B 6/02038 as they typically involve a graded index multimode fibre. 1 mm core graded POF is classified in G02B 6/02038.

G02B 6/0285

Illustrative example of the subject matter classified in this group:

(Source WO03012489).

With reference to the notes to G02B 6/03616, graded inner clad 2 is not considered a layer in the sense of G02B 6/03616. Hence these examples are not for G02B 6/03633.

G02B 6/036
Some documents define the central core as the segment from the centre to where the refractive index delta is zero (e.g. US6421490 defines “the radius from the waveguide centerline to the location of the last refractive index point is the outer radius of the core segment.”). The definition in the G02B 6/03616 notes takes precedence.

The outer cladding is also considered a layer. If the coating affects the guiding due to its refractive index then it is also considered a cladding layer. Care must be taken not to count beyond the external clad e.g. the following example has 2 clad layers, the top figure can be misleading.

(Source EP1439408).

When the profile shows many alternating refractive index layers possibly G02B 6/023 will be relevant.

G02B 6/036

Illustrative example of the subject matter classified in this group:

Radial asymmetry concept not reflected in lower subgroups. (Source WO2004023182).

G02B 6/03605
Illustrative example of the subject matter classified in this group:

(Source US2005089289).

**G02B 6/03611**

Illustrative example of the subject matter classified in this group:

(Source EP1158323).

**G02B 6/03611** as additional information is used for some documents where the profile has a centreline depression as a result of the manufacturing procedure but there is no purposeful effect on the guiding properties or dispersion properties.

(Source US2006045449).

This is however not classified in **G02B 6/03611** Since the centreline dip does not affect the optical fibre properties and it is not discussed in the document in detail.

**G02B 6/03627**

Special rules of classification

Waveguides which are not of the integrated circuit kind, are not optical fibres and are not used for illumination are classified in the subgroups G02B 6/10 - G02B 6/107. There are three exceptions: the subgroups G02B 6/102 and G02B 6/105 include both optical fibres and waveguides of the integrated circuit kind, and G02B 6/107 includes all sub-wavelength diameter waveguides.

G02B 6/12

of the integrated circuit kind (production or processing of single crystals C30B; electric integrated circuits H01L 27/00 {; coupling fibres and integrated optical circuits G02B 6/30})

Definition statement

This place covers:

Light guiding paths in an integrated circuit, particularly waveguides formed in a planar substrate, including single paths as well as multiple paths which interact with each other with or without optical elements in or between the light guiding paths. This subgroup further covers methods of producing the waveguides.

References

Special rules of classification

Wavelength selective arrangements are classified in G02B 6/12007 with the corresponding Indexing Code symbols G02B 6/293 - G02B 6/29398 assigned. For example a planar waveguide arrangement of ring resonators for wavelength selection is classified in G02B 6/12007 and G02B 6/29338.

The coupling of light within planar waveguide substrates is classified in G02B 6/12 and subgroups. Coupling light into or out of an integrated circuit having light guiding paths is classified in the appropriate one of G02B 6/26, G02B 6/30 - G02B 6/305, G02B 6/34, G02B 6/3956, G02B 6/42 and G02B 6/43.

G02B 6/24
Coupling light guides (for electric waveguides H01P 1/00)

References

Limiting references
This place does not cover:

| Coupling of light guides of the planar or plate like form for lighting devices or systems | G02B 6/0011 |
| Electric waveguides | H01P 1/00 |

Special rules of classification

Mechanical coupling aspects of optical elements other than the light guides is classified in the subgroup relating to the optical coupling. For example the mechanical coupling of a fixed reflective bulk diffraction grating between optical fibres is classified in G02B 6/2931, and mechanical means for holding a lens between an optical fibre and an opto-electronic element are classified in G02B 6/4204.

The mechanical coupling of light guides is classified in G02B 6/36-G02B 6/406 and/or G02B 6/42-G02B 6/43. When the mechanical coupling is for a particular type of optical coupling between light guides then the appropriate one of G02B 6/26-G02B 6/3596 is also given. For example a lens coupling together light guides which are mechanically coupled on a substrate is classified in G02B 6/36 - G02B 6/3696 and G02B 6/32.

G02B 6/26
Optical coupling means (G02B 6/36, G02B 6/42 take precedence)

Definition statement
This place covers:
The optical coupling of light into, out of or between light guides.

Further details of subgroups
G02B 6/29302

G02B 6/29316

includes gratings in contact with the light guide causing diffraction in the light guide, e.g. in contact with the side of a polished fibre (i.e. no free space, no intermediate element other than coupling medium, closely linked to diffractive elements integrated in the light guide) i.e. beam interacting with the diffractive element confined in at least one dimension transverse to propagation. EP1574883 fig. 1 has collimator between fibre and diffractive film thus is not for group G02B 6/29317 (Indexing Code G02B 6/29317 is appropriate). US4148556 fig. 3 is for group G02B 6/29322 as grating is butt coupled.

Special rules of classification

G02B 6/287 is not used for classification. G02B 6/255, G02B 6/2835, G02B 6/2856 and G02B 6/29331 are used instead.
The following arrangement is observed in relation to optical fibre couplers:

<table>
<thead>
<tr>
<th>Description</th>
<th>Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optical fibre couplers of the NxN type (e.g. 2x2)</td>

</tr>
<tr>
<td>Optical fibre couplers of the 1xN type formed by thermal treatment</td>
<td>G02B 6/2856</td>
</tr>
</tbody>
</table>

Prisms or gratings coupled to light guides for purposes other than wavelength selection are classified in G02B 6/34.

Systems for wavelength division multiplexing based on optical fibres are classified in H04J 14/02. Reference is made to the section “Relationship between large subject-matter areas” under G02B 6/00.

Planar waveguides

Couplings between separate planar waveguide substrates, e.g. using intermediate bulk optics, are classified in G02B 6/26. Planar waveguide couplings are also classified in G02B 6/30-G02B 6/305, G02B 6/34, G02B 6/3596, G02B 6/42 and G02B 6/43.

G02B 6/262-G02B 6/29398, G02B 6/32-G02B 6/327 are restricted to light guides of the optical fibre type.

The coupling of light within planar waveguide substrates is classified in G02B 6/12 and subgroups. For example optical fibre couplers are classified in G02B 6/2804 whereas planar waveguide couplers are classified in G02B 6/125. The one exception is G02B 6/3596.

In G02B 6/35 and subgroups a single subgroup is assigned (the most relevant) with further aspects classified in the Indexing Code.

Indexing Codes

No groups correspond to Indexing Codes G02B 2006/2839 and G02B 2006/2865.

Separation between G02B 6/29305 and G02B 6/29316

G02B 6/29305 is for bulk diffraction elements (gratings) with free space between the light guide and grating. This means that before interacting with the grating the light beams are not guided in the light guide for a certain distance (or vice-versa).

G02B 6/29316 is for light guides comprising the grating. This means there is no free space between the light guide and the grating and the light beams are guided in the light guide onto the grating (or vice-versa).

Examples.

G02B 6/29311

Diffractive film DF is on a collimator C. (Source EP1574883).
Butt coupled grating 50, no free space to light guide 42. (Source US4148556).

Parallel plate resonators can be in either G02B 6/29358 or G02B 6/29335 - the correct group depends on how the resonator is coupled to the light guide.

Where light is coupled into the resonator from the light guide by evanescence G02B 6/29335 is appropriate (i.e. the evanescent field of the light guided in the light guide overlaps with the resonant mode of the resonator). This is usually the case with lateral coupling, but not always.

Examples
Parallel plate resonators formed by resonator members 18, 19, 28 and 29 external to light guides 13, 23 and light coupled between resonators and light guides by deflector means 16 and 26. (Source US20070104421).

Linear resonator between 5 and 8 coupled via evanescent coupling at region 6. (Source US4859017).
Devices of the type shown in fig. 1-3 below with evanescent coupling to a linear cavity between mirrors 24 & 26 are classified in G02B 6/29337, of the type shown in fig. 4 below with evanescent coupling to a loop cavity 14a are classified in G02B 6/2934.

(Source US4720160).

Devices of the type shown in fig. 6B with evanescent coupling to a cascade of loop resonators 180 are classified in G02B 6/29343. Devices of the type shown in fig. 7A & 9C below with end coupling into cavities formed by reflective gratings (i.e. without evanescent coupling into a resonator cavity) are classified in G02B 6/29356.

(Source EP1024378).

Attention is drawn to the following places, which may be of interest for search:

| Cleaning of optical fibres and connectors | B08B 1/00 |

Special rules of classification

The mechanical coupling between optical fibres or of optical fibres with opto-electronic elements is classified in the appropriate groups of G02B 6/38 - G02B 6/3897 and G02B 6/42-G02B 6/43 and additionally in Indexing Codes G02B 6/3608-G02B 6/3696, especially when the latter are more detailed. Light guides coupled together as a splice by mechanical holding means, i.e. mechanical splices, are classified in G02B 6/3801.

The mechanical coupling of optical fibre cables and the storage of optical fibres is classified in G02B 6/4401 and subgroups.

In G02B 6/3608-G02B 6/3696 as far as possible only one subgroup is assigned with further aspects classified in Indexing Codes G02B 6/3608-G02B 6/3696.

A demountable optical fibre connector is often classified in several of the G02B 6/3807 - G02B 6/3897 subgroups and/or Indexing Codes G02B 6/3807-G02B 6/3897 to reflect the various aspects of the connector. This is especially important to allow retrieval of mechanical configurations which are not easily searchable using words.

Optical fibre connector accessories and tools, e.g. for assembling, insertion or extraction of connectors not provided for elsewhere are classified in G02B 6/3801. The testing of optical fibre connectors is classified in G02B 6/3807 and subgroups. Devices for cleaning optical fibre connectors are classified in G02B 6/4001 and circulated to B08B 1/00.

G02B 6/40-G02B 6/403 relate to optical fibre bundles in the sense of G02B 6/04.

Planar Waveguides

The mechanical coupling of planar waveguides is classified in the appropriate one of G02B 6/12-G02B 6/12033, G02B 6/30-G02B 6/305, G02B 6/42 and G02B 6/43.

**Special rules of classification**

Optical coupling aspects of light guides for illumination are classified in [G02B 6/0001 - G02B 6/0096](#).

The coupling of non coherent light, including lamps, into optical fibres for purposes other than illumination is classified in [G02B 6/4298](#).

Electric, thermal and mechanical aspects of packages not covered by [G02B 6/4202 - G02B 6/4298](#) are classified in [G02B 6/4201, G02B 6/4201 - G02B 6/4215](#) also include documents where the light guide is implicit.
The coupling of light guides with opto-electronic elements using a wavelength selective or polarisation
selective and adjusting optical element are classified in G02B 6/4215 or G02B 6/4246 and the relevant
G02B 6/27 - G02B 6/2793 and/or G02B 6/293 - G02B 6/2938, since the latter are more detailed.

Mechanical coupling aspects of optical fibre arrangements classified in G02B 6/42 - G02B 6/43 are
additionally classified in G02B 6/36 - G02B 6/3696 especially when the latter are more detailed.

Connector aspects of disconnectable light guide arrangements classified in G02B 6/4292 are also
classified in G02B 6/3807 - G02B 6/3897 and/or G02B 6/3807 - G02B 6/3897.

Planar Waveguides

Planar waveguides coupled with optoelectronic elements are classified in G02B 6/42 with
G02B 6/4201 - G02B 6/4296 assigned for the details (e.g. G02B 6/42 and G02B 6/4214), however
monolithic configurations, i.e. where the planar waveguide and optoelectronic element are grown on
the same substrate are classified in G02B 6/12004.

Indexing Codes

G02B 6/4292 has the additional Indexing Code G02B 2006/4297 for protection means, e.g. using
shutters to avoid inadvertent exposure

G02B 6/44

Mechanical structures for providing tensile strength and external protection
for fibres, e.g. optical transmission cables (cables incorporating electric
conductors and optical fibres {where features relating to the optical fibres are
not of interest} H01B 11/22)

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

| Cables incorporating electric conductors and optical fibres (where features relating to the optical fibres are not of interest) | H01B 11/22 |

Special rules of classification

G02B 6/4439-G02B 6/4478 are also used for classifying auxiliary devices with uncabled optical fibres.
For example the storage of optical fibres in spools is classified in G02B 6/4457.

Optical cable installations in buildings, for example over multiple floors, are classified in G02B 6/4466.

Indexing Codes

The subgroups G02B 6/4404, G02B 6/4408, G02B 6/4421, G02B 6/4423, G02B 6/4426,
do not have a corresponding Indexing Code.

G02B 6/46

Processes or apparatus adapted for installing optical fibres or optical cables
(installation of cables containing electric conductors and optical fibres H02G)

Special rules of classification

G02B 6/52 is not used, G02B 6/4464 and G02B 6/50-G02B 6/508 are used instead.
**G02B 6/46 (continued)**

**Indexing Codes**

No Indexing Codes exist.

**G02B 7/00**

**Mountings, adjusting means, or light-tight connections, for optical elements**

**Definition statement**

_This place covers:_

Mountings, adjusting means, including means for effecting focusing and zooming, and light-tight connections for optical elements like lenses, prisms or mirrors or the like.

**Special rules of classification**

The following simplified arrangements are to be observed in relation to mechanical aspects of focusing and zooming (G02B 7/04):

- Non-zoom systems: Manual focusing: G02B 7/04
- Non-zoom systems: Automatic (motorized) focusing: G02B 7/08
- Zoom systems: Manual focusing and zooming: G02B 7/10
- Zoom systems: Automatic (motorized) focusing and zooming: G02B 7/102

G02B 7/10 and G02B 7/102 relate to the mechanical aspects of zoom lenses (e.g. cam arrangements). The optical aspects of the design of zoom lenses are covered by G02B 15/00.

The following IPC subclasses are not used for classification: G02B 7/185 - G02B 7/198 (subject-matter covered by G02B 7/182 and other subgroups of G02B 7/182).

**G02B 9/00**

**Optical objectives characterised both by the number of the components and their arrangements according to their sign, i.e. + or - (G02B 15/00 takes precedence)**

**Definition statement**

_This place covers:_

Optical objectives characterised both by the number of the components and their arrangements according to their sign, i.e. + or -. The plus (+) symbol represents a positive lens, and the minus (-) symbol represents a negative lens.

**References**

_**Limiting references**_

_This place does not cover:_

| Optical objectives with means for varying the magnification | G02B 15/00 |

---

**Note:**

G02B 6/54 is not used, G02B 6/4465 and G02B 6/50 are used instead.
G02B 13/00

Optical objectives specially designed for the purposes specified below (with variable magnification {in general} G02B 15/00)

Definition statement
This place covers:
Optical objectives specially designed for specific purposes.

Further details of subgroups
Concerning the subgroup G02B 13/001 (miniaturised objectives for electronic devices, e.g. portable telephones, webcams, PDAs, small digital cameras), symbols from G02B 13/0015 and G02B 13/0055 will usually be assigned. In G02B 13/002, one compound lens counts as one lens. The symbol G02B 13/006 indicates the presence of a compound element. The following figures illustrate typical examples of the subject-matter found in the indicated subdivisions:

G02B 13/06

Panoramic objectives; So-called "sky lenses" {including panoramic objectives having reflecting surfaces}

Definition statement

This place covers:

Objectives designed to cover a very wide field of view not achievable by standard lens systems.

For example:

- Very wide objectives, e.g. fisheye lenses, were the increase in coverage is done at the expense of distortion correction
- Reflecting optical systems
- Multiple lens systems providing an extended field coverage

Special rules of classification

Further details of subgroups

The following simplified arrangements are to be observed in relation to the optical layout of zoom objectives. The plus (+) symbol represents a positive lens group, and the minus (-) symbol represents a negative lens group. The symbol "..." represents any subsequent groups (positive or negative):

- ... : G02B 15/177
+ - ... : G02B 15/161
+ - - ... : G02B 15/17
+ - + ... : G02B 15/173
G02B 17/00

Systems with reflecting surfaces, with or without refracting elements (microscopes G02B 21/00; telescopes, periscopes G02B 23/00; for beam splitting or combining G02B 27/10; for optical projection G02B 27/18)

Definition statement

This place covers:

Systems with reflecting surfaces, with or without refracting elements, e.g. catoptric systems, catadioptric systems

G02B 17/00, as the main group, is only for reflecting systems which do not fit into any of the sub-groups.

Example: a polar to rectangular coordinates converter:

</tbody>
</table>

Special rules of classification

G02B 17/00 in general should be seen as an optical design group.
The division with G02B 17/08 (catadioptric systems) is strict, the presence of any refracting element having power or asphere to correct the aberrations of the system qualifies the combination as catadioptric.

Solid systems (where the air is replaced by glass) are also catadioptric, even with zero power air interfaces.

Some application specific mirror systems relating to G02B are covered by groups outside this main group. However details might be classified in G02B 17/00. Examples are:
- G02B 13/06: Panoramic lenses takes precedence and should not be classified in G02B 17/06 or G02B 17/08.
- G02B 26/126: Optical F-theta scanner lenses with mirrors.
- G02B 21/04: Reflective microscope objective.
- G02B 27/642: Derotators

</table>

**G02B 17/002**

**{Arrays of reflective systems}**

**Definition statement**

*This place covers:*

Arrays of reflective systems. This is essentially to mirror systems what lens arrays are for lenses. The class can be combined with other G02B 17/02, G02B 17/04, G02B 17/06, G02B 17/08 classes describing the optical design.
G02B 17/004

{Systems comprising a plurality of reflections between two or more surfaces, e.g. cells, resonators (multipass arrangements for optical cuvettes G01N 21/031; laser resonators H01S 3/05)}

Definition statement

This place covers:

Systems comprising multiple reflections between at least two reflecting surfaces, e.g. cells, resonators. This subgroup covers both catadioptric and catoptric systems, as the number of documents is too small to justify a division between G02B 17/06 and G02B 17/08.

Special rules of classification

Further details of subgroups

The subgroups G02B 17/0605, G02B 17/0626 and G02B 17/0647 relate to systems having 2 mirrors, 3 mirrors and more than 3 mirrors respectively, and are strictly imaging groups, including linear field imaging systems (scanner optics).

The structure of these groups, by way of example for G02B 17/0605 is the following:

- G02B 17/0605 On axis systems without a central aperture.
- G02B 17/061 On axis systems, with at least one central aperture.
- G02B 17/0615 Off-axis, unobscured, optical systems, the mirrors having a common optical axis.
- G02B 17/0621 Off-axis or unobscured optical systems, the mirrors without a common optical axis, e.g. the mirrors have tilts and decenters. This includes also so-called free-form surfaces without rotational symmetry.

The general rule is to count the number of optical surfaces relevant for the optical design process:

- An optical surface on which the beam is reflected twice counts as one mirror, however single mirror having multiple zones figured with different optical surfaces counts as two mirrors.
- Simple flat folding mirrors are normally not counted when they are not essential to the invention, e.g. not relevant in the lens design process, for example a folding mirror.
- Flat mirrors are counted when they are used to achieve a double reflexion on the same mirror, e.g. when a powered mirror surface is used twice. Flat reflecting surfaces in solid catadioptric systems count also.
- When several systems are chained together, e.g. a telescope and a relay, the subsystems are counted and classified individually.

FIG 1

• G02B 17/0605 On axis systems without a central aperture.
• G02B 17/061 On axis systems, with at least one central aperture.
• G02B 17/0615 Off-axis, unobscured, optical systems, the mirrors having a common optical axis.
• G02B 17/0621 Off-axis or unobscured optical systems, the mirrors without a common optical axis, e.g. the mirrors have tilts and decenters. This includes also so-called free-form surfaces without rotational symmetry.

The general rule is to count the number of optical surfaces relevant for the optical design process:

- An optical surface on which the beam is reflected twice counts as one mirror, however single mirror having multiple zones figured with different optical surfaces counts as two mirrors.
- Simple flat folding mirrors are normally not counted when they are not essential to the invention, e.g. not relevant in the lens design process, for example a folding mirror.
- Flat mirrors are counted when they are used to achieve a double reflexion on the same mirror, e.g. when a powered mirror surface is used twice. Flat reflecting surfaces in solid catadioptric systems count also.
- When several systems are chained together, e.g. a telescope and a relay, the subsystems are counted and classified individually.
**G02B 17/0605**

![Diagram](image)

G02B 17/0668

{having non-imaging properties}

Definition statement

This place covers:

Non imaging systems.

Devices that are not emitter or receiver specific.

The group has been subdivided to cover systems disclosed as being used to illuminate a detector, or used in close conjunction with a light source (e.g. for LED illumination). Often the emitter/detector is an integral part of the device. Reflecting pipes are in G02B 27/0994 or G02B 6/00.
Example: a non-imaging system in the form of a rotating optical joint

**Special rules of classification**

**Further details of subgroups**
- **G02B 17/0673** for light condensing (emitters)
- **G02B 17/0678** in a 360° plane or hemisphere
- **G02B 17/0684** for light collecting (receivers)
- **G02B 17/0689** in a 360° plane or hemisphere

**G02B 17/0694**

{with variable magnification or multiple imaging planes, including multispectral systems (systems with only refractive elements **G02B 15/14**)}

**Definition statement**

*This place covers:*

Zoom mirror systems, but also multiple focus or multiple magnification systems, and systems having both large and small FOVs.

**G02B 17/08**

**Catadioptric systems** {(used in non-imaging applications **G02B 19/00**)}

**Definition statement**

*This place covers:*

Catadioptric systems

This group is subdivided according to the same scheme as the systems of **G02B 17/06**.
In addition, subgroups have been added to cover the structure or function of the refractive element.

### Special rules of classification

**Further details of subgroups**

**G02B 17/0852:** Field Corrector

Systems where a set of field lenses correct the aberrations of the mirrors.

The field corrector definition should be taken broadly to include systems where all lenses are located between the focal plane and the first mirror (starting from the FP).

Systems with field flattener lenses and pupil correctors get also this class when the design of the field corrector is detailed or discussed.

**G02B 17/0884:** Pupil Corrector

The pupil corrector having spherical surfaces, e.g. Maksutov or Houghton telescopes

**G02B 17/0888:** Pupil Corrector

The pupil corrector having an aspheric surface, e.g. Schmidt camera

**G02B 17/0856:** Mangin mirror, i.e. a lens with a mirrored surface

**G02B 17/086:** Solid Catadioptric, e.g. comprising solid blocks

**G02B 17/0864:** Non imaging catadioptric

The **G02B 17/0864** subgroup is subdivided according to the same scheme as the systems of **G02B 17/0668**.

**G02B 17/0892:** Specially adapted for UV (includes lithography objectives even without an explicit UV reference)

**G02B 17/0896:** With means for varying the magnification or providing a plurality of image planes from a single pupil (same rules as for **G02B 17/0694**)

The following table gives examples of patent documents classified in the subgroups of **G02B 17/06** or **G02B 17/08**: 109
G02B 17/0804
{using two curved mirrors (G02B 17/0864, G02B 17/0896 takes precedence)}

Special rules of classification

Concerning optical arrangements for illumination from LEDs, the practice is to classify in G02B 19/0061 (or G02B 19/0066 for LED arrays) and in one or more other classes under G02B 19/00 according to the optical means employed. In particular:

- Arrangements involving refractive surfaces only, at least one surface having optical power, and adapted for a single LED are classified in G02B 19/0061 and in G02B 19/0014. For example:

- Arrangements involving reflective surfaces only, at least one surface having optical power, and adapted for a single LED are classified in G02B 19/0061 and in G02B 19/0023.

- Arrangements involving reflective and refractive surfaces adapted for a single LED are classified in G02B 19/0061 and in G02B 19/0028. For example:
In the above examples, the classification G02B 19/0071 is additionally given in the case of adaptation to illuminate a complete hemisphere or a plane extending 360° around the source. For example, the following arrangement would be classified in G02B 19/0061, G02B 19/0028 and G02B 19/0071:
G02B 21/00

Microscopes (eyepieces G02B 25/00; polarising systems G02B 27/28; measuring microscopes G01B 9/04; microtomes G01N 1/06; scanning-probe techniques or apparatus G01Q)

Definition statement

This place covers:

Optical microscopes including conventional microscopes, as well as laser scanning microscopes, confocal microscopes, fluorescence microscopes, video microscopes or optical aspects of surgical microscopes.

G02B 26/00

Optical devices or arrangements using movable or deformable optical elements for controlling the intensity, colour, phase, polarisation or direction of light, e.g. switching, gating, modulating (specially adapted for measuring characteristics of light G01J; using devices or arrangements the optical operation of which is modified by changing the optical properties of the medium of the devices or the arrangements G02F 1/00; control of light in general G05D 25/00; control of light sources H01S 3/10, H05B 37/00 - H05B 43/00; mechanically operable parts of lighting devices for the control of light F21V)

Definition statement

This place covers:
Optical devices or arrangements using movable or deformable optical elements for controlling the intensity, colour, phase, polarisation or direction of light, e.g. switching, gating, modulating
Relationships with other classification places

Optical devices or arrangements the optical operation of which involves changing the optical properties of the material used by an applied field or force G02F 1/00

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

| Gyricon | The term gyricon refers to a type of electronic paper in the form of a thin layer of transparent plastic in which millions of small "bichromal" beads (i.e. with hemispheres of two contrasting colors) are randomly dispersed. When a voltage is applied, the beads rotate to present one colored side to the viewer, allowing images such as text and pictures to be displayed. |

G02B 26/001

{based on interference in an adjustable optical cavity (interference filters G02B 5/28; devices or arrangements using multiple reflections in spectrometry or monochromators G01J 3/26)}

Definition statement

This place covers:

Systems providing spectral filtering by an adjustable, e.g. variable spacing, optical cavity.

Relationships with other classification places

Adjustable Fabry-Perot devices in spectroscopy applications, e.g. as monochromators or for spectral analysis are classified in G01J 3/26. A further classification in G02B 26/001 is optional.

References

Limiting references

This place does not cover:

| Non adjustable interference filters | G02B 5/28 |
Devices or arrangements using multiple reflections in spectrometry or monochromators

G02B 26/026

{based on the rotation of particles under the influence of an external field, e.g. gyricons, twisting ball displays (based on orientable dipolar particles G02F 1/172; based on electrophoresis G02F 1/167)}

Definition statement

This place covers:
All documents describing rotating particle displays ("gyricons" etc.) are to be classified in G02B 26/026, for example:

However, electrophoretic displays (involving particles moving linearly under the influence of an electric field) are classified in G02F 1/167.

Control of the intensity of light based on variable absorption of orientable dipolar particles is classified in G02F 1/172.

**Special rules of classification**

Further details of other subgroups of \textit{G02B 27/00}, like \textit{G02B 27/10} through \textit{G02B 27/44} see below after the definition of \textit{G02B 27/01}. Note: the format is not yet the final format and remains to be dealt with by editorial board. It is noted that the definition of \textit{G02B 27/22} was already available in the earlier version of this current document.

The following IPC subclass is not used for classification \textit{G02B 27/18}, see the relevant subclasses according to the projector type. The subclass \textit{G02B 27/20} is however used for laser pointers or the like.

**G02B 27/01**

**Head-up displays**

**Definition statement**

This place covers:

Devices for superimposing a synthetic image on a background scene by projection of a synthetic image on a background scene on a partially transparent surface:

- head mounted, e.g. pilot helmets
- non head mounted, e.g. windscreen of a car
- optical features
- mechanical features
- display position adjusting means not related to the information which is to be displayed
- sight systems

Examples of subject matter covered are:

Projection of flight or drive data on the windscreen of a plane or of a car (see for example US2011298693 paragraphs [0022],[0023], figure 1).
Vizor of pilots helmet with a partially transparent surface ("helmet mounted displays")

**Special rules of classification**

Further details covered by G02B 27/01 and not provided for in any of its subgroups is provided for in the subgroups of Indexing Codes G02B 27/01 and below. Classification is obligatory.

Further details of other subgroups of G02B 27/00

**G02B 27/10**: Beam splitting or combining systems

The scheme comprises subgroups covering specific structural technical solutions ("means") and a parallel set of subgroups covering the purposes of the devices, independently of the specific type of beamsplitter used.

The subgroup G02B 27/10 is intended for beamsplitting/combining systems which cannot be given any lower means subgroup in the scheme. In general, documents should be assigned at least one means subgroup and at least one purpose subgroup.

**Purpose Subgroups: Examples**

G02B 27/1006 for splitting or combining different wavelengths

For wavelength specific documents which are not covered by any lower entry.

All color imaging related documents are in the color sensing subgroup (G02B 27/1013) or in one of the color reproducing subgroups (G02B 27/102 and subgroups). These subgroups are not limited to RGB devices and cover also non visible or pseudocolor devices as long as the final image is intended for the human viewer.

G02B 27/1013
For color or multispectral image sensors, e.g. splitting an image into monochromatic image components on respective sensors.

The devices must be imaging devices, including line scanning. Other spectral sensing devices belong to G02B 27/1006.

G02B 27/102

For generating a color image from monochromatic image signal sources.

Essentially covers color generating systems not specifically designed for a particular type of SLM, e.g. illumination systems combining multiple light sources.

G02B 27/1026

For use with reflective spatial light modulators
Having a single light modulator for all colour channels

G02B 27/104
For use with scanning systems

Beams splitter/combiner arrangement for color scanning display arrangements

G02B 27/1046
For use with transmissive spatial light modulators
The "classic" 3 LCD projector;

**G02B 27/1053**

Using a single light modulator for all colour channels

for example time sequential led sources used with a single SLM, US2006196944
could be extended to light pipes: EP1003064

**G02B 27/106**

For splitting or combining a plurality of identical beams or images, e.g. image replication.

Quite a few documents deal with obtaining multiple identical copies of a beam. The numbers of beam should be four or more, color aspects are not relevant for this class.

US2006082890: construction laser
DE3502382: Laser beam replication.
Characterized by manufacturing or alignment methods, e.g. assembly of cross dichroic cubes.

The subgroup is also relevant for mechanical aspects and devices where the alignment of the beams requires a particular construction (equivalent to G02B 7/00 for beamsplitters).

G02B 27/1066

For enhancing image performance, e.g. resolution, pixel numbers, dual magnifications or dynamic range, by tiling, slicing or overlapping fields of view. Covers sensing or imaging devices where fields are either
- overlapping, e.g. dual resolution or pixel shifted systems, to increase the perceived resolution or
- abutted, save some border blending, for dividing or combining a larger field of view into or from subfields, e.g. detector or display tiling, image slicing.

Resolution should be taken in a broad sense, including high dynamic range systems.
GB2222892: high resolution CRT with a low resolution LCD

WO2008129552: "foveal" devices, narrow HD field with a large low resolution field

WO98/10402: mosaic displays
CA1073715: Slicing/dividing an image

G02B 27/108

For sampling a portion of a beam or combining a small beam in a larger one, e.g. wherein the area ratio or power ratio of the divided beams significantly differs from unity, without spectral selectivity. Sampling devices for high power laser, laser beam insertion.

US4746205
Means Subgroups: Examples

The decisive criterion is the physical principle leading to the splitting or combining, and not other aspects of the device. For example a cube beamsplitting prism operates by reflecting (part of) the beam, and hence operates by reflection, even though it also has refracting surfaces. Following the optical path, the relevant surface marks the boundary between the single beam and the multiple beams.

IPC classes G02B 27/12 and G02B 27/14 refer to "refraction only" or "reflection only" but some devices use both reflecting and refracting beamsplitting structure, e.g. US6400512:

Applying strictly the IPC wording of the headers G02B 27/12 or G02B 27/14, such documents would not have their details classified in these subgroups. For the purpose of CPC classification, the limitation "only" should be disregarded. The above document would therefore be classified in G02B 27/12 (or a subgroup thereof) and G02B 27/14 (or a subgroup thereof).

G02B 27/1086

Operating by diffraction only
Polychromatic diffractive combiners may be additionally classified in G02B 27/1013 or G02B 27/102.

US2006109876

G02B 27/1093

For use with monochromatic radiation only, e.g. devices for splitting a single laser source

Since diffractive elements are intrinsically wavelength dependent, purely monochromatic devices represent special applications. G02B 27/1086 and G02B 27/1093 cover passive diffractive devices only

G02B 27/12

Operating by refraction only.

This subgroup comprises inter alia systems using birefringent materials for standard beamsplitting applications, for example not polarization relevant (polarization beamsplitters G02B 27/283).

G02B 27/123

The splitting element being a lens or a system of lenses, including arrays and surfaces with refractive power.
FR2889746: beam splitting takes place at 110a,110b

In **G02B 27/123** the optical path should be branched. Fly eye beam shaping devices belong to **G02B 27/0961**, lens arrays per se in **G02B 3/0006**.

**G02B 27/126**

The splitting element being a prism or prismatic array, including systems based on total internal reflection.
The class covers both refracting deviating prisms, including spectral deviation and systems where the splitting/combining is achieved by total internal reflection without reflecting coatings:

US2005174658

G02B 27/14

Operating by reflection only
For example a non conventional reflective beamsplitter as in US6266359:

Using dichroic mirrors

For simple dichroic mirror arrangements transmitting a wavelength band and reflecting the other. G02B 27/1006 covers color splitting in general, and RGB image analysis or synthesis is covered by G02B 27/1013 or G02B 27/102 and lower.

Coating structure, e.g. thin films multilayers.

When the focus is the structure of the beam splitter coatings (thicknesses, materials, refractive indexes) including single thin metallic layers.

JP58208701: a polarisation independent multilayer semi-transparent coating.
Macroscopically faceted or segmented reflective surfaces

The segmentation here is macroscopic, compare with G02B 27/147.

G02B 27/144

Using partially transparent surfaces without spectral selectivity (G02B 27/147 takes precedence) for conventional half-mirrors.

US5198930:

G02B 27/145

Having sequential partially reflecting surfaces
With a tree or branched structure

Using averaging effects by spatially variable reflectivity on a microscopic level, e.g. polka dots, chequered or discontinuous patterns, or rapidly moving surfaces (G02B 27/1086 takes precedence).
The subgroup also covers time averaging systems such as chopper mirrors rotating at high speed to emulate a beamsplitter.

JP52011894:

G02B 27/149
Devices incorporating crossed beamsplitting surfaces, e.g. cross-dichroic cubes or X-cubes. Not limited to three channels

Including stacked surfaces having at least one double-pass partially reflecting surface

A special type but common type of beamsplitter where at least the front surface is crossed twice. Common for RGB angular separation, the last surface can be fully reflective.

US2009251783

Used as aids for focusing

Covers split prisms historically used to focus an image in reflex cameras and has almost no activity.
There are two groups for autostereoscopic systems (i.e. systems in which left and right images projected to the left and right eyes of an observer who is not required to view the images through special glasses optical systems placed adjacent to the eyes:

Autostereoscopic systems which comprise lenticular arrays or parallax barriers are classified in G02B 27/2214.

Autostereoscopic displays which do not comprise lenticular arrays or parallax barriers, for example systems in which the left and right images are projected directly into the left and right eyes of the observer, are classified in G02B 27/225. An example of such a display is shown in the figure below.

---

**FIG. 1**

(PRIOR ART)

---

G02B 27/2271

Concerns volumetric displays, i.e. in which an image is built up from image elements distributed over a three-dimensional volume. An example is US2007/0242324, in which visible fluorescence is excited at the crossing points of two scanned invisible lasers:
There are three subgroups:

**G02B 27/2278**

The image being built up using a stack of two dimensional planes, e.g. US 2002/0130820:

![FIG. 4](image4)

![FIG. 5](image5)

![FIG. 6](image6)

![FIG. 7](image7)

**G02B 27/2285**

The volume being generated by a moving (vibrating or rotating) surface, e.g. US6115006:

![FIG. 1](image1)

**G02B 27/2292**

Projecting an aerial or floating image, typical examples of which would be WO02/061492:

FIG. 1

or WO95/19584

**G02B 27/01 (continued)**

**CPC - G02B - 2018.05**

**G02B 27/42**: Diffraction optics

**G02B 27/42** deals with systems comprising a DOE (diffractive optical element) having a significant interaction with another component of the optical system. If the document also discloses significant details about the diffractive element as such, it should be additionally classified in **G02B 5/18**. This subgroup contains documents in which the diffractive effect results from a purposeful design of a DOE. It does NOT include documents in which light is merely diffracted by an aperture, an edge or a particle. **G02B 27/4266** is an exception to this rule. **G02B 27/42** is essentially structured into two major groups:

.. imaging systems (**G02B 27/4205** and lower)

.. non-imaging systems (**G02B 27/4233** and lower).

Besides this major differentiation, there are three further divisions:

.. physical properties of the DOE:
polarization G02B 27/4261,
thermal G02B 27/4283,
spectral G02B 27/4288, G02B 27/4294
.. sequential DOEs G02B 27/4272 and G02B 27/4277
.. theory, models G02B 27/4266

In deciding whether a system is an imaging system or a non-imaging system, concepts such as image resolution or extended objects/images are strong hints towards imaging systems. On-axis point-like objects/images are pointers to non-imaging systems. It is important to note that G02B 27/4205 (and lower) and G02B 27/4233 (and lower) relate to the specific role played by the DOE in the system: a DOE within an imaging system, but merely deviating light for illumination purposes in a subsystem of the imaging system, is classified in G02B 27/4233 (or lower).

Specific rules

G02B 27/4233 (and lower) should preferably not contain documents which have a more specific class e.g. G02B 6/00 (optical fibers, waveguides), H01S (laser pulse compression), G01J (spectroscopy).

G02B 27/4238 should contain no document from the field of optical pick-up devices (these documents should be classified in G11B 7/1353).

G02B 27/425 should preferably contain no document about mask illumination in a lithographic apparatus (these documents should be classified in G03F 7/70158). This should not be confused with a DOE projecting an image of the mask onto a wafer, which is classified in G02B 27/4222.

G02B 27/4272 and G02B 27/4277 relate to plural diffractive elements positioned sequentially along the optical path means that the distance between sequential diffractive elements is large enough to ensure that each period of the subsequent grating receives diffracted light from several periods of the previous grating, i.e. far-field diffraction. For instance, DOEs which, at least in certain portions of the DOE are in direct contact or multilayered DOEs are normally not plural diffractive elements in the sense of G02B 27/4272 and G02B 27/4277.

When allocating G02B 27/42, consider also the relevance of the following classes in G02B relating to diffraction or gratings:

G02B 1/005 (photonic crystals)
G02B 1/118 (moth-eye anti-reflection structures)
G02B 5/0252 (diffusers using holographic or diffractive means)
G02B 5/18 (diffraction gratings per se)
G02B 5/203 (filters using holographic or diffractive means)
G02B 5/32 (holographic optical elements)
G02B 26/0808 (controlling direction of light)
G02B 26/106 (scanners using movable diffraction gratings)
G02B 27/0944 (beam shaping using diffractive optical elements)
G02B 27/1086 (beam splitting and combining by diffraction)
G02B 27/46 (spatial filters)
G02B 27/58 (superresolution, apodization)
G02B 27/60 (systems using moiré fringes)

Exemplary drawings for G02B 27/42

Diffraction optics, i.e. systems including a diffractive element being designed for providing a diffractive effect (G02B 27/60 takes precedence)
