#### G06F

# ELECTRIC DIGITAL DATA PROCESSING (computer systems based on specific computational models <u>G06N</u>)

#### **Definition statement**

This place covers:

Electrical arrangements or processing means for the performance of any automated operation using empirical data in electronic form for classifying, analyzing, monitoring, or carrying out calculations on the data to produce a result or event.

#### References

## Limiting references

This place does not cover:

Computer systems based on specific computational models	<u>G06N</u>
---	-------------

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Programme-control systems	G05B 19/00
Digital computers in which all the computation is effected mechanically	<u>G06C</u>
Computers in which a part of the computation is effected hydraulically or pneumatically	<u>G06D</u>
Computers in which a part of the computation is effected optically	<u>G06E</u>
Self-contained input or output peripheral equipment	<u>G06K</u>
Computer displays	<u>G09G</u>
Impedance networks using digital techniques	<u>H03H</u>

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Handling	includes processing or transporting of data.
	An association of an electric digital data processor classifiable under group G06F 7/00, with one or more arrangements classifiable under groups G06F 1/00- G06F 5/00 and G06F 9/00-G06F 13/00.

## G06F 1/00

Details not covered by groups <u>G06F 3/00</u> - <u>G06F 13/00</u> and <u>G06F 21/00</u> (architectures of general purpose stored program computers <u>G06F 15/76</u>)

## **Definition statement**

This place covers:

Details not covered by groups G06F 3/00-G06F 13/00 and G06F 21/00.

#### References

## Limiting references

This place does not cover:

Architectures of general purpose stored program computers  G06F 15/76	Architectures of general purpose stored program computers	G06F 15/76

2

## G06F 1/04

# Generating or distributing clock signals or signals derived directly therefrom

#### **Definition statement**

This place covers:

Generation and/or distribution of clock signal(s) within a computer system.

## G06F 1/10

# Distribution of clock signals {, e.g. skew}

#### **Definition statement**

This place covers:

Distribution of clock signal(s) within a computer system, in a typical case the goal to be achieved is to minimize the skew.

# {in which the distribution is at least partially optical}

#### **Definition statement**

This place covers:

Clock distribution wherein the clock signal(s) are distributed entirely optically or partially optically and partially electrically.

#### G06F 1/16

# **Constructional details or arrangements**

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Instrument details	<u>G12B</u>
Constructional details common to different types of electric apparatus	H05K 7/00

## G06F 1/1603

{Arrangements to protect the display from incident light, e.g. hoods}

## Special rules of classification

Used also for hoods protecting displays of portable computers.

#### G06F 1/1607

{Arrangements to support accessories mechanically attached to the display housing (G06F 1/1603, G06F 1/1605 take precedence)}

## Special rules of classification

Used also for accessories attached on displays of portable computers.

#### G06F 1/1613

{for portable computers (cooling arrangements therefor G06F 1/203; constructional details or arrangements for pocket calculators, electronic agendas or books G06F 15/0216; constructional details of portable telephone sets: with several bodies H04M 1/0202)}

#### **Definition statement**

This place covers:

Portable computers in the sense of computers able to be used as stand alone computers with their own integrated user interface and designed to be carried by hand (e.g. hand held computers or laptop computers) or worn on the user's body (wearable computers).

Docking stations and extensions associated with the portable computers which may be mechanically attached to them.

## Relationships with other classification places

Telephone sets including user guidance or feature selection means facilitating their use: H04M 1/247

Cordless telephones: H04M 1/725

Pagers: <u>G08B 5/222</u>

## References

## Limiting references

This place does not cover:

Cooling arrangements for portable computers	G06F 1/203
Constructional details or arrangements for pocket calculators, electronic agendas or books	G06F 15/0216
Anti-theft locking devices	E05B 73/0082
Constructional details of cameras	G03B 17/00, H04N 23/00
Hand held scanners	G06K 7/10881
Casing of remote controls	H01H 9/0235
Constructional details of portable telephone sets: with several bodies	H04M 1/0202

# Special rules of classification

In this field, main mechanical aspects of the housing (single housing, foldable or sliding housings) are classified in <u>G06F 1/1615</u> - <u>G06F 1/1626</u>, while all the other constructional details (enclosure details, display, keyboard, integrated peripherals, etc) are classified in <u>G06F 1/1633</u> in complement to this main aspect.

## Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "Laptop"," Palmtop"," PDA"
- " cell phone"," mobile phone","smart phone"

#### G06F 1/1615

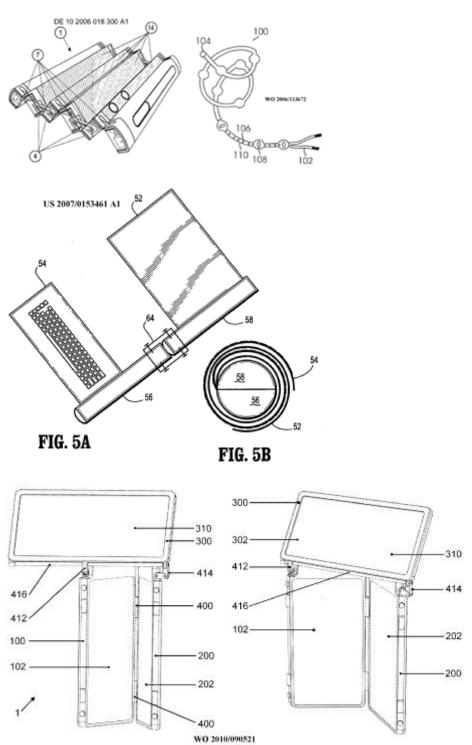

{with several enclosures having relative motions, each enclosure supporting at least one I/O or computing function (constructional details of portable telephones comprising a plurality of mechanically joined movable body parts H04M 1/0206)}

#### **Definition statement**

This place covers:

Portable computers having a plurality of enclosures which can't be classified in anyone of the subgroups, e.g. multiple enclosure with loose mechanical link (single wire, expandable or/and flexible link, rollable part), computer split in several housings with no mechanical connection and wirelessly connected, complex mechanical link with multiple degrees of freedom.

# Illustrative examples:

## References

# Limiting references

This place does not cover:

Constructional details of portable telephones comprising a plurality of	H04M 1/0206
mechanically joined movable body parts	

{with folding flat displays, e.g. laptop computers or notebooks having a clamshell configuration, with body parts pivoting to an open position around an axis parallel to the plane they define in closed position}

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Foldable portable telephones	H04M 1/0214

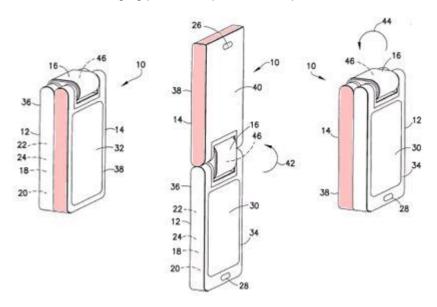

# G06F 1/1618

{the display being foldable up to the back of the other housing with a single degree of freedom, e.g. by 360° rotation over the axis defined by the rear edge of the base enclosure}

#### **Definition statement**

This place covers:

Also when the hinging part is composed of two parallel rotation axes.

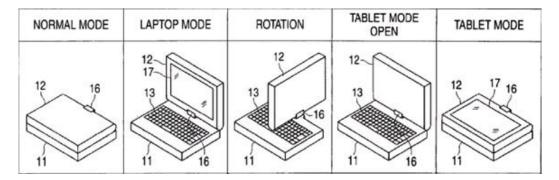

{changing, e.g. reversing, the face orientation of the screen with a two degrees of freedom mechanism, e.g. for folding into tablet PC like position or orienting towards the direction opposite to the user to show to a second user}

## **Definition statement**

This place covers:

Reversing the orientation done either by rotating along the X or Y axis or by detaching the display and attaching it in the reverse orientation. Illustrative example:

## G06F 1/1622

{with enclosures rotating around an axis perpendicular to the plane they define or with ball-joint coupling, e.g. PDA with display enclosure orientation changeable between portrait and landscape by rotation with respect to a coplanar body enclosure}

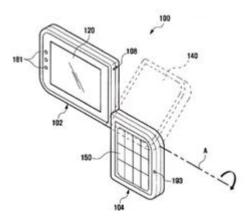

#### **Definition statement**

This place covers:

Illustrative examples of subject matter classified in this group:

Additionally rotation around an axis common to the plane they define but perpendicular to their common side, e.g. reversing the relative orientation along an axis common to both planes but not along their sides (which would be then a folding axis).

## References

# Means for saving power

#### **Definition statement**

This place covers:

Means to save power in computers, including devices, methods and combinations of devices and method features.

## G06F 1/3203

## Power management, i.e. event-based initiation of a power-saving mode

#### **Definition statement**

This place covers:

Power saving obtained by switching, in relation to events of any type, between computing device operating modalities implying different power consumption levels. As opposed to power saving arrangements and/or methods of a permanent or continuous nature.

## G06F 1/3206

# Monitoring of events, devices or parameters that trigger a change in power modality

## **Definition statement**

This place covers:

Power saving triggered by a certain event and/or condition detected by monitoring or supervision of e.g. hardware, communication, processing tasks.

## G06F 1/3215

## Monitoring of peripheral devices

#### Special rules of classification

Used when the peripheral monitored does not belong to any of the subgroups:  $\underline{\text{G06F 1/3218}}$ ,  $\underline{\text{G06F 1/3221}}$  or  $\underline{\text{G06F 1/3225}}$ .

# G06F 1/3228

# Monitoring task completion, e.g. by use of idle timers, stop commands or wait commands

#### **Definition statement**

This place covers:

Power saving initiated when a task completion is detected (typical cases are the completion of processing tasks, e.g. programs, applications, routines).

## Monitoring the presence, absence or movement of users

#### **Definition statement**

This place covers:

Power saving initiated when the user absence/presence is detected, e.g. through a camera and/or sensors.

# Relationships with other classification places

This group is not to be used when the user absence/presence is inferred by a user inactivity period, e.g. absence of keyboard input. Subgroups referring to monitoring of peripheral devices to be used in such cases, i.e. <u>G06F 1/3215</u> and subgroups.

## G06F 1/3234

## Power saving characterised by the action undertaken

## **Definition statement**

This place covers:

Power saving obtained by selectively reducing power consumption of all or individual components of a computing system. Such reduction can be achieved in different ways, e.g. by lowering the clock frequency, by stopping the supply of the clock signal, by lowering the voltage, by stopping the supply of power, by task scheduling.

## G06F 1/3237

#### by disabling clock generation or distribution

#### **Definition statement**

This place covers:

Power saving by stopping clock generation or distribution to a computer or a component.

## G06F 1/3243

#### {Power saving in microcontroller unit}

# **Definition statement**

This place covers:

Power saving taking place in the processing unit of the computer, intended as central processing unit (CPU), microcontroller unit (MCU), microprocessor.

## G06F 1/3256

## {Power saving in optical drive}

## **Definition statement**

This place covers:

Power saving in optical (or magneto-optical) disk drives, e.g. CD, DVD, Blue-Ray, etc.

## {Power saving in hard disk drive}

#### References

#### Limiting references

This place does not cover:

Power saving in storage systems (e.g. not in disk drives within a	G06F 3/0625
computer system)	

#### G06F 1/3287

# by switching off individual functional units in the computer system

#### **Definition statement**

This place covers:

Power saving by selectively reducing power consumption of individual components of a computer system. Such reduction can be achieved in different ways, e.g. by lowering the clock frequency or stopping the clock, by lowering the voltage, by stopping the power supply (power gating).

## G06F 3/00

Input arrangements for transferring data to be processed into a form capable of being handled by the computer; Output arrangements for transferring data from processing unit to output unit, e.g. interface arrangements

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Typewriters	<u>B41J</u>
Conversion of physical variables	F15B 5/00, G01
In regulating or control systems	<u>G05B</u>
Image acquisition	G06T 1/00, G06F 9/00
Coding, decoding or code conversion in general	<u>H03M</u>
Transmission of digital information	<u>H04L</u>

## G06F 3/002

{Specific input/output arrangements not covered by G06F 3/01 - G06F 3/16 (other optical apparatus G02B 27/00)}

#### **Definition statement**

This place covers:

Includes inter alia arrangements in which a barcode reader is used to input data to a computer and in particular drivers for barcode or QR code readers.

# Relationships with other classification places

Recognition of data; presentation of data; record carriers; handling record carriers: G06K.

#### References

## Limiting references

This place does not cover:

Specific input/output arrangements	G06F 3/01 - G06F 3/16
Other optical apparatus	G02B 27/00

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Viewers photographic printing	<u>G03B</u>

Constructional details of barcode readers	G06K 7/00
Reading of RFID record carriers	G06K 7/0008
Constructional details of RFID record carriers	G06K 19/07749
Use of barcode readers or RFIDs in data processing systems for business applications	G06Q
Wireless phone using NFC or a two-way short-range wireless interface	H04M 1/72412
Facsimile per se	H04N 1/00

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

TUI	a user interface in which a person interacts with digital information
	through a physical environment, i.e. by manipulating physical
	objects (e.g. in the same way as moving pieces of a game on a
	tablet), often using RFID or NFC.

## **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

TUI	Tangible User Interface
RFID	Radio-Frequency Identification
NFC	Near Field Communication

## G06F 3/005

## {Input arrangements through a video camera}

## **Definition statement**

This place covers:

Specific arrangements for input through a video camera, not covered by <u>G06F 3/01</u> - <u>G06F 3/16</u>, e.g. details of the interface linking the camera to the computer.

**Definition statement** 

This group was originally meant for devices adapting analog video cameras to computer entry.

Digital input from, or digital output to, record carriers	G06F 3/06
Digital stores in which the information is moved stepwise using magnetic elements and thin films in plane structure	G11C 19/08
Digital stores in which the information is moved stepwise using semiconductor elements	G11C 19/28
Organisation of a multiplicity of shift registers	G11C 19/287

## Special rules of classification

Old technology, not used anymore.

## G06F 3/01

Input arrangements or combined input and output arrangements for interaction between user and computer (G06F 3/16 takes precedence)

#### **Definition statement**

This place covers:

Input arrangements, or combined input and output arrangements, for interaction between user and computer.

Particularly, said input arrangements include those based on the interaction with the human body, e.g.

- · gloves for hand or finger tracking;
- · eye or head trackers;

**Definition statement** 

- devices using bioelectric signals, e.g. detecting nervous activity;
- arrangements for providing computer generated force feedback in input devices.

#### References

## Limiting references

This place does not cover:

Sound input, sound output including multimode user input, i.e. combining	G06F 3/16
audio input (e.g. voice input) with other user input	

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

are generated	

## G06F 3/012

# {Head tracking input arrangements}

## **Definition statement**

This place covers:

For the scope of this group, Head-tracking is interpreted as covering face detection and tracking.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

	G02B 27/0093, G02B 27/01
Use of head-tracking for image generation	G06T 7/00, G06T 11/00
3D image generation in augmented reality	G06T 19/006
Using viewer tracking	H04N 13/366

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

HMD	Head-Mounted Display
-----	----------------------

## G06F 3/013

## {Eye tracking input arrangements (G06F 3/015 takes precedence)}

#### References

## Limiting references

This place does not cover:

Input arrangements based on nervous system activity detection	G06F 3/015
---	------------

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Apparatus for testing the eyes and instruments for examining the eyes	A61B 3/00
Instruments for determining or recording eye movement	A61B 3/113
Acquiring or recognising eyes	G06V 40/18

## Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

"eye tracking" and "gaze tracking"

#### G06F 3/014

# {Hand-worn input/output arrangements, e.g. data gloves}

#### **Definition statement**

This place covers:

Also covers hand-worn keyboards

# Relationships with other classification places

Manipulators; chambers provided with manipulation devices: B25J

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Finger worn arrangements for converting the position or the displacement	G06F 3/03,
of a member into a coded form	G06F 2203/0331

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Data glove (sometimes called a	an input device for human-computer interaction worn like a glove
"wired glove" or "cyberglove")	

# G06F 3/015

{Input arrangements based on nervous system activity detection, e.g. brain waves [EEG] detection, electromyograms [EMG] detection, electrodermal response detection}

#### References

#### Informative references

Bioelectrical control, e.g. myoelectric	A61F 2/72

#### G06F 3/016

# {Input arrangements with force or tactile feedback as computer generated output to the user}

# **Definition statement**

This place covers:

Dynamic force or tactile feedback arrangements. Also passive feedback arrangements but only if they are dynamically reconfigurable under computer control, e.g. buttons raised from a touchpad surface using electronic muscle or similar.

# Relationships with other classification places

- Manipulators; chambers provided with manipulation devices: B25J
- Conjoint control of vehicle sub-units of different type or different function; control systems specially adapted for hybrid vehicles; road vehicle drive control systems for purposes not related to the control of a particular sub-unit: B60W
- Systems acting by means of fluids; fluid-pressure actuators, e.g. servo-motors: F15B
- Control or regulating systems in general: G05B
- Mechanical control devices: G05G

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Passive (and non reconfigurable) feedback arrangements on a touchscreen, e.g. overlays with reliefs for indicating keys of a virtual keyboard	G06F 3/04886
Hand grip control means for manipulators	B25J 13/02
Tactile feedback for vehicle driver	B60W 50/16
Servo-motor systems giving the operating person a "feeling" of the response of the actuated device	F15B 13/14
Means for enhancing the operator's awareness of arrival of the controlling member (knob, handle) at a command or datum position; Providing feel, e.g. means for creating a counterforce	G05G 5/03
Tactile presentation of information, e.g. Braille display	G09B 21/001
Keyboards characterised by tactile feedback features	H01H 13/85
Piezoelectric actuators	H10N 30/20

## G06F 3/017

{Gesture based interaction, e.g. based on a set of recognized hand gestures (interaction based on gestures traced on a digitiser G06F 3/04883)}

#### **Definition statement**

This place covers:

Gesture interaction as a sequence and/ or a combination of user movements captured using various sensing techniques such as (among others) cameras monitoring the user, arrangements for interaction with the human body, input by means of a device moved freely in 3D space or opto-electronic detection arrangements.

#### References

## Limiting references

This place does not cover:

Gestures made on the surface of a digitiser and/or in close proximity to	G06F 3/04883
this surface for digitisers capable of touchless position sensing and/or	
measuring also the distance in the Z direction	

#### Informative references

Telemetry of coordinates	G08C 21/00

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

A Tangible User Interface (TUI)	a user interface in which a person interacts with digital information
	through a physical environment, i.e. by manipulating physical
	objects (e.g. in the same way as moving pieces of a game on a
	tablet), often using RFID or NFC

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

TUI	Tangible User Interface
RFID	Radio-Frequency IDentification
NFC	Near Field Communication

{Detection arrangements using opto-electronic means (constructional details of pointing devices not related to the detection arrangement using opto-electronic means <u>G06F 3/033</u>; optical digitisers <u>G06F 3/042</u>)}

## Relationships with other classification places

If the moving part is the sensor then the subject-matter belongs to <u>G06F 3/0304</u>, if the observed target (e.g. finger) is moving then the subject-matter belongs to <u>G06F 3/042</u>.

Touch interaction within a graphical user interface [GUI]	G06F 3/0488

## Special rules of classification

In this area, Indexing Codes <u>G06F 2203/04101</u> - <u>G06F 2203/04114</u> dealing with details which may be related to different sensing technologies are used in parallel to the classification scheme.

Subgroups <u>G06F 3/0412</u> and <u>G06F 3/0416</u> -<u>G06F 3/04186</u> are not explicit to a specific sensing technology but describe details about the integration within a display or the driving/interface of the digitiser.

For documents belonging to these subgroups, if further relevant details related to the sensing technology are disclosed, the corresponding subgroup of <u>G06F 3/041</u> that is best related to the sensing technology employed should be doubly allocated as invention information.

If the sensing technology is indicated only with minor details, the sensing technology (if any) should be indicated as additional information.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Surface	either as a physical surface or as a virtual one, such as a virtual
	interaction plane floating in the air

## G06F 3/0412

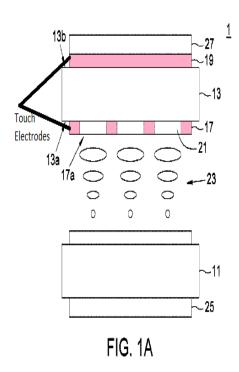

## {Digitisers structurally integrated in a display}

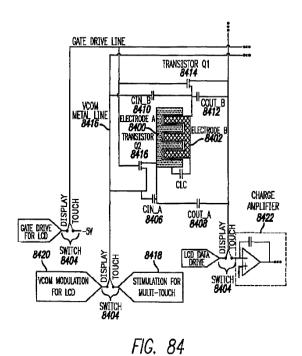

#### **Definition statement**

This place covers:

Structural details and methods of driving a combination of displays with digitisers that share at least one constitutive part of both the touch sensing technology as well as the display technology (e.g. a common electrode for LCD control and a touch electrode (i.e. driving or sensing) for capacitive touch sensing, a common electrode being used as a guard/shield electrode in touch sensing, or a common electrode that is specifically floated during a touch driving/sensing period).

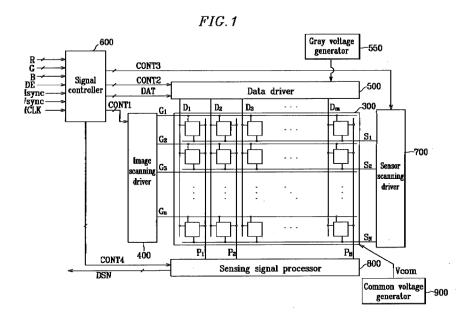

## Examples:

Structural details and methods of driving a display and a digitizer in which the digitizer is either wholly or in part within the structural confines that make up the display panel of the display device (e.g., a sensor pixel that is adjacent to the display pixel) or the sensor is arranged to utilize at least one structural component of the display panel (e.g. such as the top substrate of the display pane).

## Examples:

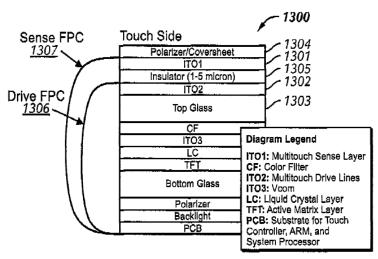

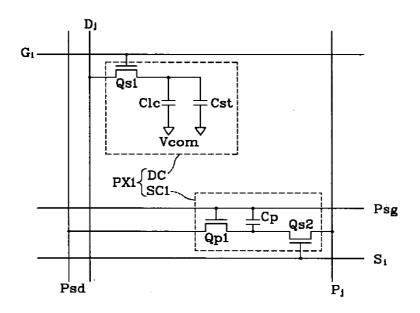

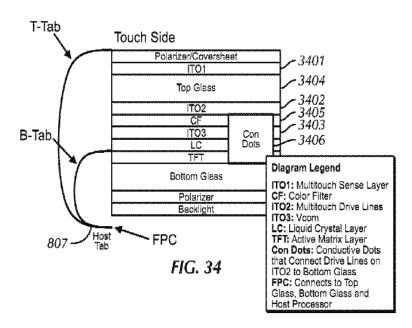

FIG. 13

## References

## Informative references

Constructional details of LCDs	G02F 1/13
Driving details of LED/OLED	G09G 3/30
Driving details of LCDs	G09G 3/36
Construction details of OLED displays	H10K 59/40

## Special rules of classification

Documents disclosing both a specific display panel (LCD, OLED etc.) and touch sensing are doubly classified in the relevant areas (for example: <u>G02F</u> for LCD, <u>H01L</u> for OLEDs, and <u>G09G</u> for methods of driving displays), pertaining to the respective types of display panels as well as in <u>G06F 3/0412</u>.

Devices in which a component is shared between touch detection circuitry and display driving circuitry, for example, a shared electrode for touch detection and display driving wherein the details of both the touch detection and the display driving are disclosed should be classified in the relevant areas either <a href="G09G">G09G</a> (depending upon the type of display device) as well as in <a href="G09F-3/0412">G06F-3/0412</a>.

Devices in which construction details of both LCD panel and touch components are disclosed, but touch detection is only nominally disclosed should be classified only in <u>G02F 1/13338</u> and only classified in <u>G06F 3/0412</u> as an Additional.

Construction details of OLED display components integrated with touch detection components wherein the disclosure primarily concerns the OLED and minimally recites touch circuitry is classified in H10K 59/40 and only classified in G06F 3/0412 as an Additional.

## G06F 3/0414

## {using force sensing means to determine a position}

#### **Definition statement**

This place covers:

Touch position determined by the analysis of the signals provided by pressure/force sensors.

## Relationships with other classification places

Measuring force or stress in general: G01L 1/00.

## References

#### Informative references

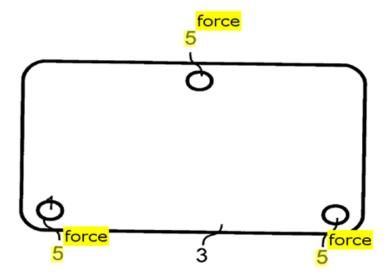

Pressure sensors for measuring the pressure or force exerted on the touch surface without providing the touch position	G06F 2203/04105

Force resistance touch switches	H03K 17/9625
Piezoelectric touch switches	H03K 17/964

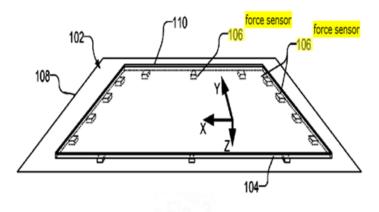

{the force sensing means being located peripherally, e.g. disposed at the corners or at the side of a touch sensing plate}

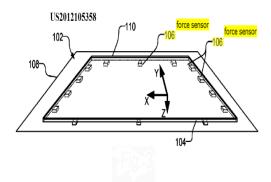

## **Definition statement**

This place covers:

Touch position determined by the analysis of the signals provided by a plurality (reduced number) of discrete pressure/force sensors disposed at several points of (e.g. under) the touch sensing surface, e.g. at the corners or the side of a touch sensing plate.

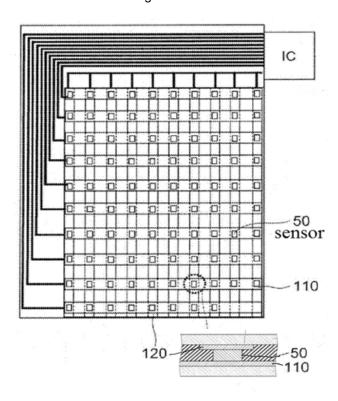

{using an array of force sensing means (position sensing using the local deformation of sensor cells  $\underline{G06F3/0447}$ )}

## **Definition statement**

This place covers:

Touch position determined by the analysis of the signals provided by either virtual pressure sensors generated by intersection nodes of a grid of sensing lines interacting with a pressure sensitive medium or an array of discrete pressure/force sensors delivering a variable (not a single Boolean 0/1) signal, the array extending over the whole area of the touch sensing surface, e.g. a grid of sensors disposed under the touch sensing surface.

#### References

## Limiting references

This place does not cover:

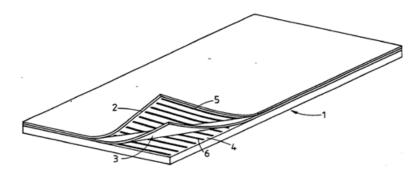

Position sensing using the local deformation of sensor cells	G06F 3/0447
--	-------------

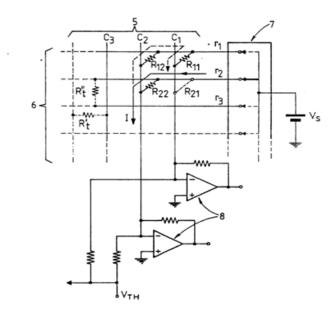

{using pressure sensitive conductive elements delivering a boolean signal and located between crossing sensing lines, e.g. located between X and Y sensing line layers}

## **Definition statement**

#### This place covers:

Digitisers having a grid of crossing wires brought into virtual contact when pressure is exerted on the interaction surface, the virtual contact is established through a pressure sensitive layer disposed between the wire layers and made of a material that resistance diminishes under an applied pressure used to provide a "binary" output. The touch position is determined only by the contacting wires (scanning line and column) and not by the analog value of the sensed signal.

## G06F 3/04162

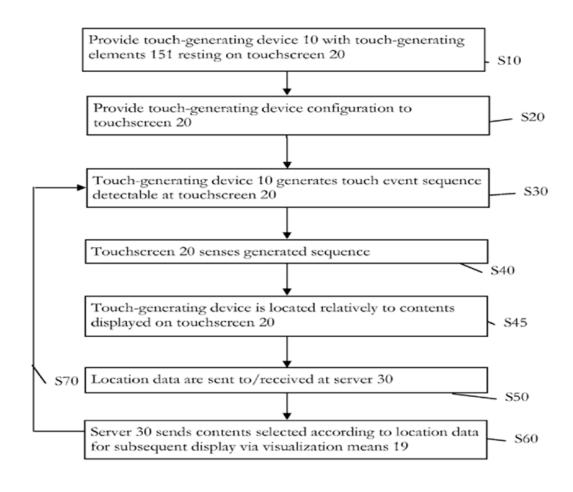

{for exchanging data with external devices, e.g. smart pens, via the digitiser sensing hardware}

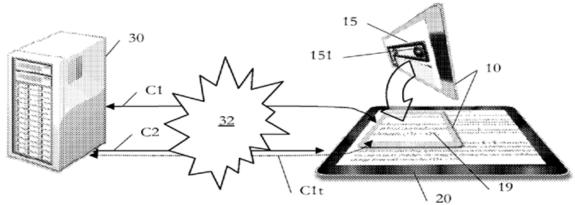

## **Definition statement**

This place covers:

Digitiser control allowing exchange of data with external devices via the digitiser sensing hardware (touch sensing electrodes, touch sensing coils, etc...), including exchange of information with smart pens as long as it concerns data transmission via the touch detection hardware.

Not for transmission of data between devices using only transmission paths other than the touch sensing hardware (e.g. wired or wireless network).

{Connections between sensors and controllers, e.g. routing lines between electrodes and connection pads}

## **Definition statement**

This place covers:

Routing between sensing electrodes and controller or connector, details on wiring and connectors.

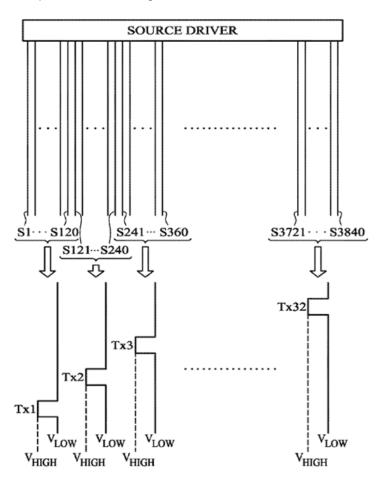

{Details of scanning methods, e.g. sampling time, grouping of sub areas or time sharing with display driving (Synchronisation with the driving of the display or the backlighting unit to avoid interferences generated internally G06F 3/04184)}

#### **Definition statement**

This place covers:

For example grouping electrodes for changing the detection speed, resolution or sensitivity (including proximity distance), detection of multiple touches, detection of both pen and finger or, combination of multiple touch technologies.

#### References

## Limiting references

This place does not cover:

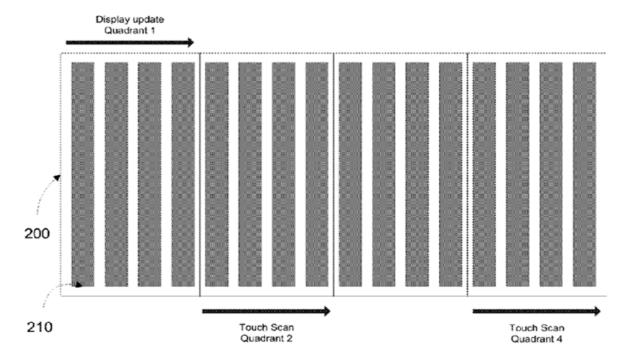

Synchronisation with the driving of the display or the backlighting unit to avoid interferences generated internally

# {Synchronisation with the driving of the display or the backlighting unit to avoid interferences generated internally}

#### **Definition statement**

This place covers:

Synchronisation of the touch detection signals with the display (or backlight) driving signals whenever the digitiser is integrated in the display or not.

#### G06F 3/04186

## {Touch location disambiguation}

#### **Definition statement**

This place covers:

Correcting or resolving an ambiguous detected touch, resulting from either

- an ambiguous touch location measured by the digitiser (e.g. correcting a detected large single touch into more than one smaller and adjacent touches, a partial touch at an edge of a digitiser into a full touch, a detected touch with an unwanted detected event like hover/palm rejection, cracks, water droplets, impurities, ghost touches, or gravity center due to tilt/angle of the input device) or
- an ambiguous interaction with a GUI on a touch screen, wherein the touch location as measured by the digitiser is unambiguous (e.g. correcting a detected touch to a user intended touch position)

## Special rules of classification

Documents disclosing disambiguation of an interaction with a GUI on a touch screen, wherein the touch location as measured by the digitiser is unambiguous, should be doubly classified in G06F 3/0488 and below.

# by opto-electronic means

# Relationships with other classification places

Optical scanners: G06K 7/10544.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Pens detecting optically their absolute position with respect to a coded surface	G06F 3/0317

Static switches using electro-optical elements in general	H03K 17/78
Optical switches	H03K 17/941
Optical touch switches	H03K 17/9627

## Special rules of classification

When there is a doubt whether the subject matter belongs to G06F 3/0304 and below or to G06F 3/042 and below, the rule of thumb is: if the moving part is the sensor then it belongs to G06F 3/0304 and below, if the observed target (e.g. finger) is moving then it belongs to G06F 3/042 and below. In any case, the subclasses G06F 3/042 and below are used only in the context of interaction with a surface as defined in G06F 3/041 or in close proximity of this surface; they are not used in the context of a true 3D interactive environment.

## **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

FTIR	Frustrated Total Internal Reflection

## {by interrupting or reflecting a light beam, e.g. optical touch-screen}

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

a narrow beam emitted in a given direction, not as a bright band of light or as an omnidirectional lightening; in the context of beams propagating from one side towards receivers on the opposite side in a grid like arrangement, the beam may have a triangular (or conical) shape with a slightly broader opening angle in order to be sensed by several receivers on the opposite side but not covering
the whole array of receivers.

# {using a single layer of sensing electrodes}

# **Definition statement**

## This place covers:

Digitisers using a single layer of sensing electrodes, i.e. sense and/or drive electrodes. The electrodes may be interconnected by bridges at crossings. The connecting bridge may be in another layer but all the sensing electrodes are in the same one.

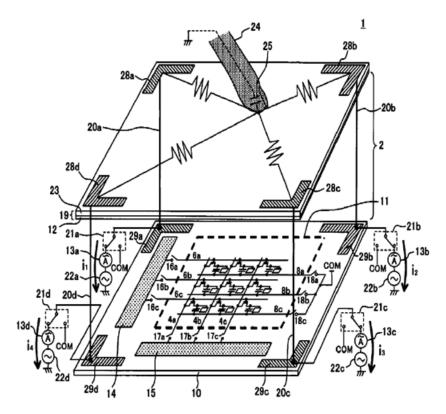

{using a single conductive element covering the whole sensing surface, e.g. by sensing the electrical current flowing at the corners}

## **Definition statement**

This place covers:

Digitisers using a single layer of sensing electrode which is made of a single piece of conducting material extending on the detection area and covered by a dielectric material.

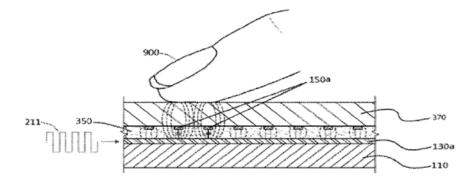

{using two or more layers of sensing electrodes, e.g. using two layers of electrodes separated by a dielectric layer}

#### **Definition statement**

This place covers:

Digitisers using at least two layers of sensing electrodes, i.e. sense and/or drive electrodes, separated either by a solid dielectric layer or by a gap which could be filled by a dielectric material.

# G06F 3/0446

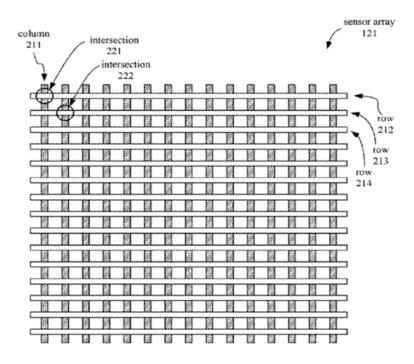

{using a grid-like structure of electrodes in at least two directions, e.g. using row and column electrodes}

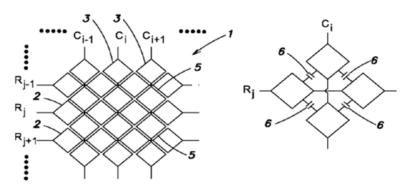

#### **Definition statement**

This place covers:

Digitisers comprising a plurality of sets of parallel sensing and/or driving electrodes extending in at least two crossing directions; each "row" or "column" electrode may be either a single piece electrode

or a plurality of interconnected electrodes (e.g. via bridges over the electrodes in the crossing direction) making a virtual electrode extending along the given direction.

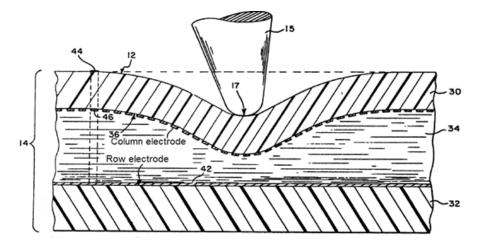

# {Position sensing using the local deformation of sensor cells}

### **Definition statement**

This place covers:

Digitisers comprising an array of cells, e.g. made by the crossing of "row" and "column" electrodes, which are deformed under the pressure of a touching object, inducing a change in their capacitance.

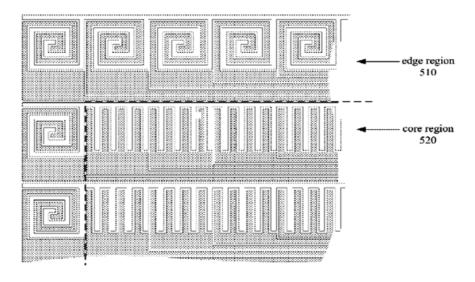

# G06F 3/0448

{Details of the electrode shape, e.g. for enhancing the detection of touches, for generating specific electric field shapes, for enhancing display quality}

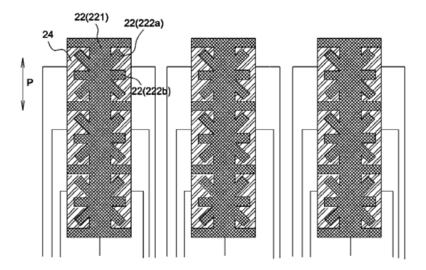

### **Definition statement**

This place covers:

The electrodes have shapes optimised to obtain a specific effect, e.g. increasing fringe field, better resolution or avoiding moiré effect.

If the electrode design or pattern exhibits an irregular or non-conventional shape without mentioning any specific effect then this symbol should be allocated as additional information.

#### using sets of wires, e.g. crossed wires

#### **Definition statement**

This place covers:

Digitisers having a grid of crossing wires brought into contact when pressure is exerted on the interaction surface. The contact may be a direct contact or through a pressure sensitive switch making a connection between the wires. It includes arrays of switches integrated in a display where a galvanic contact is established between rows and columns when the user presses the display surface.

## Special rules of classification

When wires or switches are integrated in a display, G06F 3/0412 should also be used.

# G06F 3/048

### Interaction techniques based on graphical user interfaces [GUI]

## **Definition statement**

This place covers:

Subject matter where the focus is on the way the user can interact with the displayed data, usually by means of pointing devices, irrespective of the type of data treated by the software application or the type of device embedding data processing capability.

As to the design of an interaction technique, this is most commonly determined by one or more of three factors, also in combination:

- the specific behaviour or appearance, of the graphical element or virtual environment;
- the kind of input events that can be generated by a specific input device used to interact with the displayed elements of the GUI;
- the type of operation or function to be performed with relation to these elements.

### Relationships with other classification places

GUIs are widely used to interact with any type of software application, (e.g. operating system, word-processing or information retrieval applications, spreadsheets, etc.), executed on a general-purpose computer or on a specific device (e.g. car navigation system, telephone, photocopy machine).

Documents mentioning or implying the presence of a standard GUI in the context of the disclosure of a specific software application or a specific device capable of processing data related to its specific function, should be in general classified in the appropriate subclasses related to those software applications or specific devices.

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

GUI	Graphical User Interface
-----	--------------------------

# G06F 3/0481

based on specific properties of the displayed interaction object or a metaphorbased environment, e.g. interaction with desktop elements like windows or icons, or assisted by a cursor's changing behaviour or appearance

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Cursor (also called (mouse)	an indicator used to show the position on a computer display that
pointer)	will respond to input from a text input or pointing device

### G06F 3/04812

Interaction techniques based on cursor appearance or behaviour, e.g. being affected by the presence of displayed objects

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Interaction techniques based on cursor behaviour involving tactile or force feedback	G06F 3/016
Interaction techniques for the selection of a displayed object	G06F 3/04842

# G06F 3/04815

Interaction with a metaphor-based environment or interaction object displayed as three-dimensional, e.g. changing the user viewpoint with respect to the environment or object

#### References

#### Informative references

Video games	A63F 13/00
1 9	<u> </u>

Navigational instruments, e.g. visual route guidance using 3D or perspective road maps (including 3D objects and buildings)	G01C 21/3635, G01C 21/3638

Navigation within 3D models or images (Walk- or flight-through a virtual museum, a virtual building, a virtual landscape etc.)	G06T 19/003

# using icons (graphical or visual programming using iconic symbols **G06F 8/34**)

### **Definition statement**

This place covers:

Documents describing icons having a specific (or unconventional) design or specific properties.

### References

# Limiting references

This place does not cover:

Graphical programming languages using iconic symbols	G06F 8/34	
--	-----------	--

### G06F 3/0482

# Interaction with lists of selectable items, e.g. menus

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

User interfaces specially adapted for operating a cordless or mobile telephone by selecting functions from two or more displayed items, e.g. menus or icons	H04M 1/72469
Menu-type displays in TV receivers	H04N 21/47

# G06F 3/0483

# Interaction with page-structured environments, e.g. book metaphor

### **Definition statement**

This place covers:

Documents which relate to tabs.

Interaction techniques of e-books when they are heavily book-inspired.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Electronic books, also known as e-books	G06F 15/02,
	G06F 15/0283

# G06F 3/0484

for the control of specific functions or operations, e.g. selecting or manipulating an object, an image or a displayed text element, setting a parameter value or selecting a range

# References

# Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Edit or processing of text	G06F 40/10
----------------------------	------------

#### G06F 3/04842

# Selection of displayed objects or displayed text elements (G06F 3/0482 takes precedence)

#### **Definition statement**

This place covers:

GUI interaction techniques specifically designed for selecting a displayed object, e.g. a window or an icon.

Selection by a pointing device (in the sense of G06F 3/03) such as a mouse, a joystick, a digitiser, etc.

#### References

#### Limiting references

This place does not cover:

Interaction with lists of selectable items, e.g. menus	G06F 3/0482
--	-------------

# Special rules of classification

There are some older documents relating to selection by keyboard classified here. However, all new documents related to the latter are now classified in G06F 3/0489.

Every time a set of displayed of objects can be consider as structured as a "list of selectable items", the interaction technique for selecting an item should be classified in G06F 3/0482.

# for image manipulation, e.g. dragging, rotation, expansion or change of colour

### **Definition statement**

This place covers:

Image manipulation, e.g. dragging or rotation of the whole image, resizing of objects, changing their colour etc.

### References

#### Informative references

# Special rules of classification

Each document should receive regarding "invention information":

- at least one classification in the range <u>G06F 3/0602</u> <u>G06F 3/0626</u> for the technical effect achieved and
- at least one classification in the range G06F 3/0628 G06F 3/0667 for the technique used and
- at least one classification in the range G06F 3/0668 G06F 3/0689 for the infrastructure involved.

The classification of "additional information" is optional. CPC symbols in the range <u>G06F 2206/1004</u> - <u>G06F 2206/1014</u> should be used for classifying "additional information".

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Storage system	An integrated collection of (a.) storage controllers and/or host bus
	adapters, (b.) storage devices such as disks, CD-ROMs, tapes,
	media loaders and robots, and (c.) any required control software,
	that provides storage services to one or more computers

# Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- host
- computer
- PC
- PDA
- smartphone
- (micro)processor
- CPU
- terminal
- client

### G06F 3/0605

# {by facilitating the interaction with a user or administrator}

#### **Definition statement**

This place covers:

Facilitating administration like automating recurrent tasks, selecting and presenting management information to the system user or administrator.

# {by facilitating the process of upgrading existing storage systems, e.g. for improving compatibility between host and storage device}

#### **Definition statement**

This place covers:

Facilitating administration in relation to modification of existing systems, improving compatibility and scalability.

### G06F 3/0608

### {Saving storage space on storage systems}

#### **Definition statement**

This place covers:

Effects leading to the reduction of the volume of data stored and the storage space requirements e.g. storage efficiency: the ratio of storage system's effective capacity to its raw capacity.

### Special rules of classification

This group is often combined with the technique G06F 3/0641: data de-duplication.

# G06F 3/0611

# {in relation to response time}

#### **Definition statement**

This place covers:

Reducing I/O operation latency time, i.e. the time between the making of an I/O request and the completion of the request's execution.

#### G06F 3/0613

### {in relation to throughput}

#### **Definition statement**

This place covers:

Increasing I/O operation throughput, i.e. the number of I/O requests satisfied in a given time e.g. expressed in I/O requests/second (IOPS).

### G06F 3/0614

# {Improving the reliability of storage systems}

#### **Definition statement**

This place covers:

Only reliability effects with a technique specific for G06F 3/06 should be classified in this subgroup range.

#### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Error detection or correction by redundancy in operation	G06F 11/14
Redundancy in hardware using active fault-masking	G06F 11/20

### G06F 3/0616

# {in relation to life time, e.g. increasing Mean Time Between Failures [MTBF]}

#### **Definition statement**

This place covers:

Increasing the life expectancy measured in e.g. Mean Time Between Failures (MTBF)

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

User address space allocation in block erasable memory:	G06F 12/0246
Auxiliary circuits for EPROMs:	G11C 16/06

# Special rules of classification

The subject covered by this group is often described in relation to non-volatile semiconductor memory (arrays), which are, as peculiar storage infrastructure, also classified in G06F 3/0679 or G06F 3/0688

### G06F 3/0617

# {in relation to availability}

#### **Definition statement**

This place covers:

Increasing availability, i.e. the amount of time the system is available during those time periods it is expected to be available, measured in e.g. hours of downtime in a year.

#### References

#### Informative references

Redundancy in operation:	G06F 11/14
Redundancy in hardware using active fault-masking:	G06F 11/20

# {in relation to data integrity, e.g. data losses, bit errors}

### **Definition statement**

This place covers:

Avoiding data to be altered or lost in operation or by accident.

#### References

#### Informative references

Adding special bits or symbols to the coded information in memories:	G06F 11/1008
Backing up (Point in time copy), restoring or mirroring files or drives:	G06F 11/1446
Redundancy in hardware by mirroring:	G06F 11/2056
Error detection or correction in digital recording or reproducing:	G11B 20/18

# G06F 3/062

# {Securing storage systems}

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Protecting data against unauthorised access or modification	G06F 21/60
Protecting computer components used for data storage	G06F 21/78
Arrangements for network security	H04L 63/00

# G06F 3/0622

### {in relation to access}

### **Definition statement**

This place covers:

Securing storage systems by preventing unauthorised access to the storage system, e.g. with a password.

### G06F 3/0623

# {in relation to content}

#### **Definition statement**

This place covers:

Securing storage systems by protecting the data content, e.g. by scrambing the content.

# {Power saving in storage systems}

#### **Definition statement**

This place covers:

Reducing the power consumption of a storage system, i.e. power efficiency.

Power saving in storage systems with a plurality of storage devices external to the computer.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Power saving in a single storage device inside a computer	G06F 1/3221
Driving, starting, stopping record carriers	G11B 19/00

# Special rules of classification

This group is usually combined with the technique <u>G06F 3/0634</u> (configuration or reconfiguration of storage systems by changing the state or mode of one or more devices).

This group is usually combined with the infrastructure <u>G06F 3/0689</u> (disk arrays) or <u>G06F 3/067</u> (distributed storage).

# G06F 3/0626

# {Reducing size or complexity of storage systems}

#### **Definition statement**

This place covers:

Reducing the physical size, simplifying the physical integration of storage systems

# Special rules of classification

This group is often combined with <u>G06F 3/0658</u> (controller construction) in order to characterise the technique for the "invention information", e.g. System On Chip (SOC) controller.

### G06F 3/0628

# {making use of a particular technique}

#### **Definition statement**

This place covers:

This group is the hierarchical head group for the range <u>G06F 3/0629</u> - <u>G06F 3/0667</u> related to particular storage techniques and is not used for classification.

# {Configuration or reconfiguration of storage systems}

#### **Definition statement**

This place covers:

Configuration or reconfiguration aspects.

The general management of storage system features and behaviours through the control of changes made to hardware, software, firmware and related resources throughout the life cycle of the storage system.

### G06F 3/0631

# {by allocating resources to storage systems}

#### **Definition statement**

This place covers:

Allocating physical and/or logical storage resources, including storage elements, storage devices, appliances, virtual devices, disk volume and file resources.

### Relationships with other classification places

Virtualisation techniques for the allocation of storage areas such as thin-provisioning are classified in G06F 3/0665.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Management of already existing partitions	G06F 3/0644
Allocation of resources in multiprogramming arrangements	G06F 9/50
Addressing or allocation	G06F 12/02

### G06F 3/0632

### {by initialisation or re-initialisation of storage systems}

#### **Definition statement**

This place covers:

- The startup and initial configuration of a storage device, system, piece of software or network.
- The process of installing or removing hardware or software components required for a system or subsystem to function.
- Assignment of the operating parameters of a system, subsystem or device, such as designating
  a disk array's member disks or extents and parameters such as stripe depth, RAID model, cache
  allowance, etc.
- The collection of a system's hardware and software components and operating parameters.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Program loading or initiating	G06F 9/445
-------------------------------	------------

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

, ,	Assignment of the disks and operating parameters for a disk array by setting parameters such as stripe depth, RAID model, cache
	allowance, spare disk assignments, etc. The arrangement of disks and operating parameters that results from such an assignment.

### G06F 3/0634

# {by changing the state or mode of one or more devices}

### **Definition statement**

This place covers:

Changing the operating state or mode or parameters of one or more storage devices e.g. changing the rotational speed (measured in RPM) or powering on/off or spinning up/down one or more storage devices.

# Special rules of classification

This group is often assigned when there is a power saving effect mentioned see G06F 3/0625

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

•	A storage system comprising an array of disk drives that are powered down individually or in groups when not required. MAID
	storage systems reduce the power consumed by a storage array, at the cost of increased Mean Time To Data.

### Synonyms and Keywords

In patent documents, the following abbreviations are often used:

MAID	Massive Array of Idle Disks
------	-----------------------------

### G06F 3/0635

### {by changing the path, e.g. traffic rerouting, path reconfiguration}

### **Definition statement**

This place covers:

Changing the configuration of a storage system by changing the interconnections in between storage system components or changing the routes over which the data flows from the host to the storage device and vice versa e.g. storage switches, storage ports, routing aspects in storage systems.

#### References

#### Informative references

Distributed storage of data in networks, e.g. transport arrangements	H04L 67/1097
for network file system [NFS], storage area networks [SAN] or network	
attached storage [NAS]	

# Special rules of classification

This group is usually combined with <u>G06F 3/0607</u>: improving administration by facilitating the process of upgrading existing storage systems.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

•	The combination of adapters, addresses and routes through a switching fabric used by a computer to communicate with a
	storage device.

# G06F 3/0637

# {Permissions}

#### **Definition statement**

This place covers:

Techniques related to the right of a user or host or group of users or group of hosts to access specific parts of a storage system, e.g. zoning, locking, shared access

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Protecting computer components used for data storage	G06F 21/78
Access control in arrangements for network security e.g. Access Control Lists (ACL)	H04L 63/10

# Special rules of classification

This group is usually combined with the effect G06F 3/0622: securing storage system in relation to access

### G06F 3/0638

# {Organizing or formatting or addressing of data}

#### **Definition statement**

This place covers:

Data organising, formatting or addressing, e.g. compression of data in general in a storage interface.

**Definition statement** 

Mapping aspects: conversion between two address spaces, such as the conversion between physical disk block addresses and logical disk block addresses of virtual disks presented to operating environments by control software, i.e. by using mapping tables which contain the correspondence between the two address spaces being mapped to each other.

Partitioning of storage systems, i.e. the creation of partitions.

# Relationships with other classification places

- Creation of partitions in a formatted disk is classified in G06F 3/0638.
- Allocation of existing partitions is classified in G06F 3/0631.

#### References

#### Informative references

Data compression in computer networks	H04L 69/04
Video compression	H04N 19/00

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Partitioning	Presentation of the usable storage capacity of a disk or array to an operating environment in the form of several virtual disks whose aggregate capacity approximates that of the underlying physical or virtual disk. Partitioning is common in MS-DOS, Windows, and UNIX environments. Partitioning is useful with hosts that cannot support the full capacity of a large disk or array as one device. It
	can also be useful administratively, for example, to create hard subdivisions of a large virtual disk.

### G06F 3/064

### {Management of blocks}

#### **Definition statement**

This place covers:

Techniques related to the management of blocks in storage systems

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Block	The unit in which data is stored and retrieved on disk and tape
	devices; the atomic unit of data recognition (through a preamble
	and block header) and protection (through a CRC or ECC).

Glossary of terms

Block addressing	An algorithm for uniquely identifying blocks of data stored on disk
	or tape media by number, and then translating these numbers into
	physical locations on the media.

### G06F 3/0641

# {De-duplication techniques}

### **Definition statement**

This place covers:

Techniques related to data de-duplication, i.e. the replacement of multiple copies of data - at variable levels of granularity - with references to a shared copy in order to save storage space and/or bandwidth.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

### G06F 3/0646

# {Horizontal data movement in storage systems, i.e. moving data in between storage devices or systems}

### **Definition statement**

This place covers:

Aspects of horizontal moving of data between storage devices or systems.

# G06F 3/0647

# {Migration mechanisms}

# **Definition statement**

This place covers:

Movement of data or information between information systems, formats, or media. Migration is performed for reasons such as possible decay of storage media, obsolete hardware or software (including obsolete data formats), changing performance requirements (see tiered storage), the need for cost efficiencies etc.

### Special rules of classification

HSM and Tiered storage aspect are usually combined with <u>G06F 3/0685</u> (hierarchical storage) in order to characterise the infrastructure.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Tiered storage	Storage that is physically partitioned into multiple distinct classes based on price, performance or other attributes. Data may be dynamically moved among classes in a tiered storage implementation based on access activity or other considerations.
Hierarchical Storage Management (HSM)	The automated migration of data objects among storage devices, usually based on inactivity. Hierarchical storage management is based on the concept of a cost-performance storage hierarchy. By accepting lower access performance (higher access times), one can store objects less expensively.

# G06F 3/0649

# {Lifecycle management}

### **Definition statement**

This place covers:

Data Lifecycle Management (DLM) comprising the policies, processes, practices, services and tools used to align the business value of data with the most appropriate and cost-effective storage infrastructure from the point in time when data is created through its final disposition. Data is aligned with business requirements through management policies and service levels associated with performance, availability, recoverability, cost, etc. DLM is a subset of Information Lifecycle Management (ILM).

By automatically moving less frequently accessed objects to lower levels in the hierarchy, higher cost storage is freed for more active objects, and a better overall cost to performance ratio is achieved

### Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- Retention policy
- · Retention time

# {Replication mechanisms}

#### **Definition statement**

This place covers:

Replication is the technique of sharing information so as to ensure consistency between redundant resources, such as software or hardware components, to improve reliability, fault-tolerance, or accessibility.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Backing up (Point in time copy), restoring or mirroring files or drives	G06F 11/1402
Redundancy in hardware by mirroring	G06F 11/2056

### Special rules of classification

This group is usually combined with <u>G06F 3/0614</u> (improving the reliability of storage systems) and subgroups in order to characterise the effect achieved by the replication mechanism.

### Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- Remote copy
- Mirroring
- Snapshot

### G06F 3/0652

### {Erasing, e.g. deleting, data cleaning, moving of data to a wastebasket}

### **Definition statement**

This place covers:

Erasing of data in storage systems including secure erasure.

Clearing memory, e.g. to prevent the data from being stolen	G06F 2221/2143

### Special rules of classification

This group is often combined with <u>G06F 3/0623</u> (securing storage systems in relation to content) in order to characterise the effect achieved by the invention

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Data shredding	The technique of deleting data that is intended to make the data
	unrecoverable. One such process consists of repeated overwrites
	of data on disk. Data shredding is not generally held to make
	data completely unrecoverable in the face of modern forensic
	techniques—that requires shredding of the disks themselves.

# G06F 3/0653

# {Monitoring storage devices or systems}

#### **Definition statement**

This place covers:

Monitoring aspects related to storage interfaces, i.e. extra functionality for observing properties of a running storage device or storage system in its normal operating conditions without inputting test data.

#### References

#### Informative references

### G06F 3/0656

### {Data buffering arrangements}

#### **Definition statement**

This place covers:

Arrangements using one or more buffers whereby a buffer is a memory device or programming construct, used to hold data momentarily as it moves along an I/O path or between software components.

Typically, a solid state memory device is used as a buffer. However, any storage device with faster access properties in relation to the storage device it is buffering can be used, e.g. a disk drive can act as a buffer for a tape device.

Detection or prevention of read or write errors by using a data buffer	G11B 19/044

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

A region of a physical memory storage used to temporarily hold data while it is being moved from one place to another. It often adjusts timing by implementing a queue algorithm in memory, simultaneously writing data into the queue at one rate and reading
it at another rate.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

- FIFO
- queue

# G06F 3/0658

# **(Controller construction arrangements)**

### **Definition statement**

This place covers:

Constructional details of the storage interface not elsewhere provided for.

Physical connecting arrangements not elsewhere provided for.

Hardware arrangements of storage interface components like processors, bridges, offload engines, state machines

Attention is drawn to the following places, which may be of interest for search:

Data buffering G06F 3/0656
----------------------------

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

_	Term used to describe the method computer operating systems decide the order in which block I/O operations will be submitted to
	storage volumes.

# Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- I/O scheduling
- · disk scheduling

### G06F 3/0661

# **{Format or protocol conversion arrangements}**

#### **Definition statement**

This place covers:

Techniques related to the conversion of recording formats, e.g. conversion from Count Key Data (CKD) format from a mainframe to Fixed Block Architecture (FBA) format of an open systems computer.

Techniques related to the conversion of storage protocols; bridging hardware e.g. conversion from Small Computer System Interface (SCSI) protocol to an Advanced Technology Attachment (ATA) protocol.

# {Virtualisation aspects}

#### **Definition statement**

This place covers:

Storage virtualisation refers to:

- The act of abstracting, hiding, or isolating the internal functions of a storage (sub)system or service from applications, host computers, or general network resources, for the purpose of enabling application and network-independent management of storage or data.
- The application of virtualisation to storage services or devices for the purpose of aggregating functions or devices, hiding complexity, or adding new capabilities to lower level storage resources.

#### G06F 3/0664

# {at device level, e.g. emulation of a storage device or system}

### **Definition statement**

This place covers:

Devices presented to an operating environment by control software or by a volume manager. From an application standpoint, a virtual device is equivalent to a physical one. In some implementations, virtual devices may differ from physical ones at the operating system level, e.g., booting from a host based disk array may not be possible.

Storage device emulation, e.g. disk emulation.

Storage (sub)system emulation, e. g. Virtual Tape System.

Port virtualisation on a storage network switch, storage interface virtualisation.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Program control for peripheral devices where the program performs an	G06F 13/105
input/output emulation function	

#### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	A set of disk blocks presented to an operating environment as a range of consecutively numbered logical blocks with disk-like storage and I/O semantics.
Virtual tape	A virtual device with the characteristics of a tape.

Virtual tape: a virtual device with the characteristics of a tape.

# {at area level, e.g. provisioning of virtual or logical volumes}

#### **Definition statement**

This place covers:

Storage area virtualisation, i.e. the act of applying virtualisation to one or more area based (storage) services for the purpose of providing a new aggregated, higher level—e.g., richer, simpler, more secure—storage area service to clients.

Thin provisioning.

Dynamic allocation of logical volumes.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Thin provisioning (also, dynamic	A technology that allocates the physical capacity of a volume or file
provisioning)	system as applications write data, rather than preallocating all the
	physical capacity at the time of provisioning.

# G06F 3/0667

# {at data level, e.g. file, record or object virtualisation}

#### **Definition statement**

This place covers:

Object virtualisation:

- The use of virtualisation to present several underlying objects as one single composite object.
- The use of virtualisation to present an integrated object interface when object data and metadata are managed separately in the storage system.

# Special rules of classification

This group contains older documents (published before the year 2000) from which the majority are not reorganised in the <u>G06F 3/1201</u> and its subgroups. No new/recent documents should be classified in <u>G06F 3/1201</u>.

Each new document should receive regarding "invention information":

- at least one class in the sub-groups of G06F 3/1202 for the technical effect achieved;
- at least one class in the sub-groups of G06F 3/1223 for the technique used and
- optionally one class in the sub-groups of G06F 3/1278 for the infrastructure involved.

Class in <u>G06F 3/1278</u> is added only if the infrastructure plays a major role in the "invention information".

The classification of "additional information" is optional.

Indexing Code symbols in the sub-groups of  $\underline{G06F\ 3/1202}$  and/or  $\underline{G06F\ 3/1223}$  and/or  $\underline{G06F\ 3/1223}$  and/or  $\underline{G06F\ 2206/15}$  should be used for classifying "additional information".

The older documents should be retrieved using Indexing Codes:

- G06F 3/1293 Printer information exchange with computer;
- G06F 3/1294 Status or feedback related to information exchange;
- G06F 3/1295 Buffering means;
- G06F 3/1296 Printer job scheduling or printer resource handling;
- G06F 3/1297 Printer code translation, conversion, emulation, compression; Configuration of printer parameters;
- <u>G06F 3/1298</u> Printer language recognition, e.g. program control language, page description language.

The "additional information" can be found by combining the above Indexing Code(s) with the Indexing Code G06F 3/1201.

## **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

"image forming device/apparatus", "image processing device/apparatus", "image printing device/apparatus", "image output device/apparatus", "image control device/apparatus" and "information processing device/apparatus" and "MFP Multi-Function Printer"

## G06F 3/1202

## {specifically adapted to achieve a particular effect}

## Special rules of classification

This group is not used for classifying documents in it, but to introduce one of the three classification criteria mentioned in the "Special rules for classification" section of <u>G06F 3/1201</u>.

#### G06F 3/1203

# {Improving or facilitating administration, e.g. print management}

#### **Definition statement**

This place covers:

All general aspects of printing management which do not fit in the sub-groups.

#### G06F 3/1204

{resulting in reduced user or operator actions, e.g. presetting, automatic actions, using hardware token storing data}

#### **Definition statement**

This place covers:

Preventing the user or operator from / avoiding the need for doing complicated and burdensome actions related to the printing of a document.

## G06F 3/1205

{resulting in increased flexibility in print job configuration, e.g. job settings, print requirements, job tickets}

#### **Definition statement**

This place covers:

Assisting or helping the user during print job configuration, e.g. increasing granularity in job configuration, achieving more customised settings, proposing suitable settings, preventing selection of incompatible or undesirable print options.

#### Special rules of classification

This group is usually combined with <u>G06F 3/1253</u> and its sub-groups in order to characterise the technique for the "invention information".

# {resulting in increased flexibility in input data format or job format or job type}

#### **Definition statement**

This place covers:

Assisting or helping the user to send a print job regardless of the format or type of data that should be printed. Facilitating usage of old print systems with new print systems, more specifically when compatibility between old data formats and new data formats should be achieved.

## G06F 3/1207

# {resulting in the user being informed about print result after a job submission}

#### **Definition statement**

This place covers:

All aspects that make the user aware of what happened with the print job after it being sent.

### Special rules of classification

This group is usually combined with <u>G06F 3/1259</u> and its sub-groups in order to characterise the technique for the "invention information".

#### G06F 3/1208

# {resulting in improved quality of the output result, e.g. print layout, colours, workflows, print preview}

### **Definition statement**

This place covers:

Assisting the user to increase the quality of print output (e.g. matching print output to what was intended by the user, increasing the appeal of the print output), e.g. by using preview screens, test printing. Actions or processing directed to higher fidelity.

#### Special rules of classification

This group is usually combined with <u>G06F 3/1253</u> and its sub-groups in order to characterise the technique for the "invention information".

## G06F 3/1209

# {resulting in adapted or bridged legacy communication protocols, e.g. emulation, protocol extension}

#### **Definition statement**

This place covers:

Facilitating usage of old print systems with new print systems, more specifically when compatibility between protocols should be achieved. Modifying/enhancing legacy communication protocols to extend their use into (additional) printing environments or print-related functionality (e.g. modifying Bluetooth to adapt to printing --> Basic Printing Profile (BPP)).

# {Facilitating exception or error detection and recovery, e.g. fault, media or consumables depleted}

#### **Definition statement**

This place covers:

Assisting or helping the user to predict or deal with faults, e.g. device faults, lack of consumables, communication errors. Recovering from faults.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Error or fault reporting or storing

G06F 11/0766

### G06F 3/1211

# {Improving printing performance}

#### **Definition statement**

This place covers:

All aspects of making the job to be printed faster that do not fit in the sub-groups.

## G06F 3/1212

## {achieving reduced delay between job submission and print start}

#### **Definition statement**

This place covers:

Decreasing the time between sending a print job (e.g. pressing "print" button) and actual start of the same job at the print device.

#### G06F 3/1213

## {at an intermediate node or at the final node}

#### **Definition statement**

This place covers:

Achieving decreasing the time at the node where the job is either temporarily stored (e.g. computer, server, printer) or actually printed (the printer).

## G06F 3/1214

## {at the submitting node}

#### **Definition statement**

This place covers:

Achieving decreasing the time at the node where the job is initiated from (e.g. computer, server, printer).

# {achieving increased printing speed, i.e. reducing the time between printing start and printing end}

#### **Definition statement**

This place covers:

Decreasing the time actually spent to print the job, once printing has commenced, at the print device.

#### References

## Limiting references

This place does not cover:

Reducing the time between arriving of the job at the printer till actual print	G06F 3/1213.
process starts.	

## G06F 3/1217

{achieving reduced idle time at the output device or increased asset utilization}

#### **Definition statement**

This place covers:

Decreasing the time during which the printer is doing nothing.

## G06F 3/1218

{Reducing or saving of used resources, e.g. avoiding waste of consumables or improving usage of hardware resources}

#### **Definition statement**

This place covers:

Saving resources of the printer used for printing a job.

# G06F 3/1219

{with regard to consumables, e.g. ink, toner, paper}

#### **Definition statement**

This place covers:

Preventing waste of used consumables (see for example US2011051164).

#### G06F 3/122

{with regard to computing resources, e.g. memory, CPU}

#### **Definition statement**

This place covers:

Optimal usage of system's hardware resources.

### References

### Limiting references

This place does not cover:

Reducing the number of required printer devices

G06F 3/1217.

## G06F 3/1221

## **{with regard to power consumption}**

## **Definition statement**

This place covers:

Power saving; reducing energy consumption.

## Special rules of classification

This group is usually combined with <u>G06F 3/1229</u> and its sub-groups in order to characterise the technique for the "invention information".

## G06F 3/1222

# {Increasing security of the print job}

#### **Definition statement**

This place covers:

Adding secure aspects to a print job. Preventing unauthorised printing of a job, limiting the printing based on user credentials.

## Special rules of classification

This group is usually combined with <u>G06F 3/1238</u>, <u>G06F 3/1239</u> or <u>G06F 3/1234</u> in order to characterise the technique for the "invention information".

## G06F 3/1223

## {specifically adapted to use a particular technique}

## Special rules of classification

This group is not used for classifying documents in it, but to introduce one of the three classification criteria mentioned in the "Special rules for classification" section of G06F 3/1201.

## G06F 3/1224

## {Client or server resources management}

## **Definition statement**

This place covers:

All aspects that deal with the software or hardware resources of the client or server which do not fit in the sub-groups (see e.g. US2011013223, US2009007151).

# {Software update, e.g. print driver, modules, plug-ins, fonts}

#### **Definition statement**

This place covers:

Updating or installing printer drivers on the client or server. Adding additional functionality to existing printer drivers (e.g. installing plug-ins, downloading printer definition files). Support for newly installed printers by replacing/updating existing drivers.

## G06F 3/1226

## (Discovery of devices having required properties)

#### **Definition statement**

This place covers:

The client or the server sends requests to find suitable printers for printing based on certain requirements, e.g. colour, double side printing, finishing options, status, location, supported encryption, etc.

#### References

#### Informative references

# G06F 3/123

## {Software or firmware update, e.g. device firmware management}

#### **Definition statement**

This place covers:

Downloading or updating of printer's firmware. Installing new software for supporting newly added hardware or additional functions (e.g. image processing functions, resident fonts, support for new data formats).

#### G06F 3/1231

# {Device related settings, e.g. IP address, Name, Identification}

## **Definition statement**

This place covers:

Update or initialisation of the printer specific properties - IP address, Device name (see e.g. EP1372059, US2005151988).

### References

## Limiting references

This place does not cover:

Printer device capabilities G06F 3/1232
---

# G06F 3/1232

# {Transmitting printer device capabilities, e.g. upon request or periodically}

## **Definition statement**

This place covers:

Transmitting to the requestor printing device capabilities, e.g. double side printing, finishing options, dpi, colour or b/w, ppm (see e.g. EP1435565, EP1178393).

# References

## Limiting references

This place does not cover:

Virus detection and handling.	G06F 21/56
-------------------------------	------------

# {Restricting the usage of resources, e.g. usage or user levels, credit limit, consumables, special fonts}

#### **Definition statement**

This place covers:

Limiting the use of printing as such (e.g. credit limit) or limiting the use of printers (e.g. time the printer can be used, e.g. only 1 hour a day, only after 17:00). Restricting configuration options, e.g. to plain paper, to black ink only, double-sided or n-up printing, lower resolution, limited image effects.

# Special rules of classification

This group is usually combined with <u>G06F 3/1219</u> or <u>G06F 3/122</u> in order to characterise the effect achieved by the "invention information".

## G06F 3/124

## {Parallel printing or parallel ripping}

#### **Definition statement**

This place covers:

Printing or ripping several portions of a job at the same time.

## Special rules of classification

This group is usually combined with <u>G06F 3/1215</u> in order to characterise the effect achieved by the "invention information".

## G06F 3/1241

# {Dividing a job according to job requirements, e.g. black/white and colour pages, covers and body of books, tabs}

#### **Definition statement**

This place covers:

Print job is divided and different parts are sent to different devices having different properties.

# References

This place does not cover:

Dividing for parallel printing	G06F 3/124
--------------------------------	------------

## G06F 3/1242

# {Image or content composition onto a page}

## **Definition statement**

This place covers:

Composing or overlaying content from different sources, e.g. different documents, onto a page.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

2D [Two Dimensional] image generation	G06T 11/60
Image acquisition	G06V 10/10

## G06F 3/1243

{Variable data printing, e.g. document forms, templates, labels, coupons, advertisements, logos, watermarks, transactional printing, fixed content versioning}

#### **Definition statement**

This place covers:

Print data for a page is generated by combining two sets of content (such as text, graphics and images), one set being constant from page to page (fixed content) and the other set being different (variable content) for every page. The combining of fixed and variable data may take place at any step in a print workflow.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Document retrieval systems	G06F 16/93
Editing, e.g. inserting or deleting	G06F 40/166

#### G06F 3/1244

# {Job translation or job parsing, e.g. page banding}

#### **Definition statement**

This place covers:

All aspects of transforming the print job in order to be printed which do not fit in the sub-groups, e.g. parsing in order to eliminate repetitive data, colour transformation, font transformation.

## G06F 3/1245

## {by conversion to intermediate or common format}

## **Definition statement**

This place covers:

Conversion or translation of the initial document or print job to a format which is not yet ready to be handled by a target printer but is useful for certain manipulation, e.g. faster to transmit, more efficient to store, easy to secure. Conversion or translation to a format which, although it could be suitable to certain printers, may not be suitable for the target printer (e.g. converting to a print format before target printer is known).

# {by handling markup languages, e.g. XSL, XML, HTML}

#### **Definition statement**

This place covers:

Parsing of print jobs written in one of the mark-up languages.

## G06F 3/1247

# {by conversion to printer ready format}

#### **Definition statement**

This place covers:

Conversion or translation of the initial print job (or the job in an intermediate format) to a format which is ready to be handled by the target printer.

## G06F 3/1248

# {by printer language recognition, e.g. PDL, PCL, PDF}

#### **Definition statement**

This place covers:

Parsing of the job in order to find a certain mark (or keyword) that identify the language of the job.

### G06F 3/125

## {Page layout or assigning input pages onto output media, e.g. imposition}

## **Definition statement**

This place covers:

Arrangement of the product's pages (e.g. document pages) on the output medium (e.g. paper sheets or media roll).

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

## G06F 3/1251

## {for continuous media, e.g. web media, rolls}

#### **Definition statement**

This place covers:

Specifically adapted to when media to be fed by the printer is of long length, e.g. web media, rolls.

# {for sheet based media}

#### **Definition statement**

This place covers:

Specifically adapted to when media to be fed by the printer is of short length, e.g. sheets (regardless of whether said media is to be folded or cut after printing. See e.g. US2010039670).

## G06F 3/1253

# {Configuration of print job parameters, e.g. using UI at the client}

### **Definition statement**

This place covers:

All aspects of configuring how the job should be printed which do not fit in the sub-groups.

## G06F 3/1254

# {Automatic configuration, e.g. by driver}

#### **Definition statement**

This place covers:

Automatic allocation of (some) print settings by software, e.g. print driver, (on the client or server) when a print job is to be printed.

#### Special rules of classification

Double classification possible if G06F 3/1239 also apply.

## G06F 3/1255

# {Settings incompatibility, e.g. constraints, user requirements vs. device capabilities}

## **Definition statement**

This place covers:

Limiting the possibilities given to the user at the time of configuring print job, e.g. in b/w printer hide the option for colour printing, hide the option for double side printing if the printer does not support it or if "transparencies" is selected as media (see e.g. WO2010016234).

Comparing how the job should be printed and what the printer can offer when the job is sent from the client. Automatic adjusting of some of job's settings in order to fit the printer's settings or asking the user to solve the conflict settings manually (see e.g. EP1986410).

# Special rules of classification

This group is usually combined with  $\underline{\text{G06F 3/1204}}$  or  $\underline{\text{G06F 3/1208}}$  in order to characterise the effect achieved by the "invention information".

# {User feedback, e.g. print preview, test print, proofing, pre-flight checks}

#### **Definition statement**

This place covers:

Techniques for checking how the job will look like when printed either by using a preview on a display, by checks performed by software (pre-flight, pre-press) or by real print of part of the job.

## Special rules of classification

This group is usually combined with <u>G06F 3/1208</u> in order to characterise the effect achieved by the "invention information"

## G06F 3/1257

## {by using pre-stored settings, e.g. job templates, presets, print styles}

#### **Definition statement**

This place covers:

Previously defined settings are stored (e.g. as a template) and, when configuring a new print job, the stored settings are used instead of selecting a value for each print option.

#### References

## Limiting references

This place does not cover:

Document templates, i.e. fixed content	G06F 3/1242

## Special rules of classification

This group is usually combined with <u>G06F 3/1204</u> in order to characterise the effect achieved by the "invention information".

## G06F 3/1258

## {by updating job settings at the printer}

# **Definition statement**

This place covers:

Changing/updating of settings of a received or currently being created print job using UI of the printer.

#### G06F 3/1259

### {Print job monitoring, e.g. job status}

### **Definition statement**

This place covers:

Supervising of a print job after being sent for printing, e.g. printed, failed, queued. Job status can be requested (by the sending node) or received automatically after job sending.

#### References

# Limiting references

This place does not cover:

Printer device status	G06F 3/1229.
Printer device status	<u>G00F 3/1229</u> .

## Special rules of classification

This group is usually combined with <u>G06F 3/1207</u> in order to characterise the effect achieved by the "invention information".

# G06F 3/126

# {Job scheduling, e.g. queuing, determine appropriate device}

#### **Definition statement**

This place covers:

Techniques relating to where and/or when the job should be printed which do not fit in the sub-groups. Queuing the jobs before printing, e.g. waiting a long job to finish. Finding a printer based on the job requirements.

### References

### Limiting references

This place does not cover:

Determining appropriate device aiming at providing the user with more	G06F 3/1226.
print destinations or at installing required software for discovered devices	

# G06F 3/1261

## {by using alternate printing}

## **Definition statement**

This place covers:

Determining different (alternative) device for printing a job if the designated device can not print the job, e.g. due to failure, lacking of resources or excessive delay expected (see e.g. US7027169).

#### References

### Limiting references

This place does not cover:

The same job printed by the same print device after recovered from a	G06F 3/1234
failure (i.e. reprinted)	

# {by grouping or ganging jobs}

#### **Definition statement**

This place covers:

Combining several print jobs in one job (group job), printing print jobs in batches (e.g. jobs requiring same media or same post-processing, jobs submitted by the same user or intended for the same recipient) (see e.g.WO2008039689).

## G06F 3/1263

# {based on job priority, e.g. re-arranging the order of jobs, e.g. the printing sequence}

#### **Definition statement**

This place covers:

Changing the order of print jobs according certain priorities - either user-defined or automatically determined.

## G06F 3/1264

# {by assigning post-processing resources}

## **Definition statement**

This place covers:

Determining resources to perform actions/functions on printed output (i.e. after printing) as specified by the job settings (e.g. folding, cutting, trimming, binding).

#### G06F 3/1265

# {Printing by reference, e.g. retrieving document/image data for a job from a source mentioned in the job}

#### **Definition statement**

This place covers:

The print job as submitted does not comprise the document or print data that should be printed but only a reference to it or to its location (e.g. a URL, a file path). The document is later (e.g. when queuing the job or shortly before printing should commence) obtained from its location.

## G06F 3/1267

## {Job repository, e.g. non-scheduled jobs, delay printing}

#### **Definition statement**

This place covers:

Storing a print job for a certain time before it being printed (e.g. a job to be printed at or after a certain time) or in case it should be re-printed subsequently. Storing the job until certain condition is fulfilled, e.g. user authorisation, recovering from an error state...

#### References

---	------------

#### G06F 3/1268

# {Job submission, e.g. submitting print job order or request not the print data itself}

#### **Definition statement**

This place covers:

Sending a request to print a job. The real job data will be sent or requested later. All aspects of sending a print request (e.g. submitting a document for printing, submitting a print job or a print order) which do not fit in the sub-groups.

#### References

## Limiting references

This place does not cover:

Printing by reference	<u>G06F 3/1265</u> .
-----------------------	----------------------

## Special rules of classification

Specific ways to send a request to print a job, e.g. scanning a page with a barcode and receiving printed pages with information identified by the barcode from a remote source.

## G06F 3/1269

## {by broadcasting server}

#### **Definition statement**

This place covers:

Server storing user's desires about receiving printed materials, e.g. subscription, and sending personalized print jobs to all users (or users' printers) accordingly.

#### G06F 3/127

# {by using hot folders, e.g. folder for which print settings or print data management rules are set in advance}

# **Definition statement**

This place covers:

Folders with associated printing instructions (e.g. print settings or print-related tasks, such as automatic notifications). When a document or job is sent to a folder it will be processed according to the printing instructions associated with the folder.

### References

Attention is drawn to the following places, which may be of interest for search:

Printing by reference	G06F 3/1265
-----------------------	-------------

## G06F 3/1272

# {Digital storefront, e.g. e-ordering, web2print, submitting a job from a remote submission screen}

#### **Definition statement**

This place covers:

Configuring and submitting a job using online based resources, e.g. accessing remote print service providers, choosing from web based content.

# G06F 3/1273

{Print job history, e.g. logging, accounting, tracking}

### **Definition statement**

This place covers:

Creating, managing and using of print job history (see e.g. EP1860546).

## {Deleting of print job}

#### **Definition statement**

This place covers:

Specifically instructing or managing job deletion based on certain criteria, e.g. memory usage, privacy, avoiding mixing of received jobs (see e.g. US2005275864).

## G06F 3/1275

# {Print workflow management, e.g. defining or changing a workflow, cross publishing}

#### **Definition statement**

This place covers:

Designing or modifying the steps to be performed to a print request from choosing document(s) to be printed to finalising the printed job (e.g. post-processing actions). Adding conditional steps, e.g. what should happen in case of certain events (see e.g.US2008170254).

## G06F 3/1276

# {within a printer driver, e.g. driver resides either on a server or on a client}

#### **Definition statement**

This place covers:

Print workflow management is done by the driver, regardless where it resides - client or server.

#### G06F 3/1277

## {using filter pipeline, e.g. outside the driver, adding traps}

#### **Definition statement**

This place covers:

No driver is involved in the filter pipeline. Workflow formed by pieces of software, called "filters" (see e.g. US2002135800).

#### References

#### Limiting references

This place does not cover:

Filters within a printer driver.

G06F 3/1276

## G06F 3/1278

# {specifically adapted to adopt a particular infrastructure}

## **Special rules of classification**

This group is not used for classifying documents in it, but to introduce one of the three classification criteria mentioned in the "Special rules for classification" section of G06F 3/1201.

# {Controller construction, e.g. aspects of the interface hardware}

#### **Definition statement**

This place covers:

All aspects of hardware structure of the interface controller of the printer device if the "invention information" mainly focuses on them.

## G06F 3/128

# {Direct printing, e.g. sending document file, using memory stick, printing from a camera}

#### **Definition statement**

This place covers:

Printing from an USB stick or digital camera directly connected to the printer device.

## G06F 3/1281

{Multi engine printer devices, e.g. one entity having multiple output engines}

## **Definition statement**

This place covers:

Printer device having plurality of print engines in order to increase printing speed.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Parallel printing or parallel ripping	G06F 3/124.

## G06F 3/1289

# {in server-client-printer device configuration, e.g. the server does not see the printer}

#### **Definition statement**

This place covers:

Network configuration where the information from the server to the printer device always goes via the client.

{in server-printer device-client configuration, e.g. print flow goes from server to printer and then bidirectional from printer to client, i.e. the client does not communicate with the server}

#### **Definition statement**

This place covers:

Network configuration where the client accesses the server via the printer.

## G06F 3/13

# Digital output to plotter {; Cooperation and interconnection of the plotter with other functional units}

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Arrangements for producing a permanent visual presentation of the	G06K 15/22
output data using plotters	

## G06F 3/14

# Digital output to display device {; Cooperation and interconnection of the display device with other functional units}

## **Definition statement**

This place covers:

- Interfaces between processor and display system (with or without a standard bus).
- Multiple busses connecting processor, display system and/or other subsystems: e.g. video zoom busses, multimedia busses besides the standard bus.
- Data being furnished to the display system being generated by a multiplicity of sources.
- Data of different types being furnished to the system that displays the data (it can be a display system or a complete computer).
- Interfaces between the host and the display system, especially for system that have a structure different from the structure outlined above (older or special systems).
- Plurality of symbol or graphics generators cooperating with one display unit.
- Aspects of the operating system that have impact on the display system and are not related to a particular aspect of the physical construction of the display.
- Transferring data from an Internet host to the display system.
- kvm-switches, if they (also) switch between a plurality of data sources (i.e. computers).

## Relationships with other classification places

Data handling that is pertinent neither to the kind of visualisation unit that is used nor to the frame buffer access is to be classified in G09G 5/39.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Arrangements for producing a permanent visual presentation of the output data	G06K 15/00
Control of display in general	<u>G09G</u>
Kvm-switches, only linked to one computer as data source	<u>G09G 5/006</u>
Audio-visual communications	H04N 7/14

# Special rules of classification

When a standard bus is present, documents will be classified only if they contain details of the standard interface that are peculiar for the display system; "Non-standard" bus interfaces include all bus interfaces (SPI, LVDS, MIPI).

#### G06F 3/1415

{with means for detecting differences between the image stored in the host and the images displayed on the displays}

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Digital output to display device involving copying of the display data of	G06F 3/1462
a local workstation or window to a remote workstation or window so that	
an actual copy of the data is displayed simultaneously on two or more	
displays	

#### G06F 3/1423

# {controlling a plurality of local displays, e.g. CRT and flat panel display}

#### **Definition statement**

This place covers:

Display devices in which more than one display unit is connected to the display system, irrespective of the type of display.

#### Relationships with other classification places

In cases where one display (device) controller controls two displays, group <u>G09G 2360/04</u> should be considered for classification.

Controlling a plurality of local displays, with or without display controller: When more than one display terminal is controlled by a local host and some details of the display controller are present, this should be classified in group G06F 3/1423. The controlling of "plurality of displays" takes precedence over the "display controller" in group G09G 5/363.

Conflict between "plurality of local displays" and "conversion of CRT signals for a flat panel":

Group  $\underline{G09G\ 5/366}$  covers display systems with more than one display, namely the CRT and the LCD. In these cases, classification should be given in  $\underline{G06F\ 3/1423}$  or  $\underline{G06F\ 3/1431}$  or  $\underline{G06F\ 3/1438}$  and

Relationships with other classification places

<u>G09G 5/366</u>: if the subject matter is mainly the interface, then classification in groups <u>G06F 3/1423</u> or <u>G06F 3/1431</u> or <u>G06F 3/1438</u> is preferred; if it is the graphic controller, then symbol <u>G09G 5/366</u> should be given. For search see also <u>G09G 2360/04</u>.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Using a single graphics controller	G06F 3/1431
Using more than one graphics controller	G06F 3/1438

## G06F 3/1431

# {using a single graphics controller}

#### **Definition statement**

This place covers:

One single graphics controller (VGA, SVGA or other systems) controls two or more display units. Often one graphics controller card has interface circuitry for interfacing to CRT and to flat panel.

## Special rules of classification

Documents are classified in <u>G06F 3/1431</u> or <u>G06F 3/1438</u> if there is a "graphics controller" present in the system, i.e. an interface between the standard bus and the display terminal that contains a graphics processor and a frame bufer. If the plurality of displays are connected to the host processor in a different, non standard, way, or if it is not possible to determine if a graphics controller is present (like for example in the old fashoned "terminals"), the documents will be classified in <u>G06F 3/1423</u>.

# {display composed of modules, e.g. video walls}

#### **Definition statement**

This place covers:

Illustrative example of subject matter classified in this group:

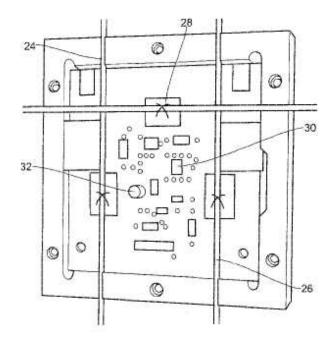

FIG. 3

## Special rules of classification

See also G09G 2300/026

## G06F 3/1454

{involving copying of the display data of a local workstation or window to a remote workstation or window so that an actual copy of the data is displayed simultaneously on two or more displays, e.g. teledisplay}

## **Definition statement**

This place covers:

Also screen sharing where the framebuffer is sent to remote displays, as is commonly done in application sharing (well known as Virtual Network Computing (VNC)).

## Examples:

- Remote display on X-windows terminals: the rendering is done centrally, and only the modified sections of the frame buffers are sent to the remote stations. This is a case of remote local display. There is no teledisplay in this case because the remote display stations are acting as terminals of the host.
- Teledisplay: A collaborative work support system that is performed on plural computers each of which is assigned for an operator, and supports collaborative work in which the plural computers

**Definition statement** 

display common data and each operator operates the displayed common data through his own computer.

• Sharing of display panel information between several screens in classrooms with a white board.

## G06F 3/162

# {Interface to dedicated audio devices, e.g. audio drivers, interface to CODECs}

## **Definition statement**

This place covers:

Dedicated hardware or software components for interfacing to an audio device i.e. translating the audio stream from a host into a format accepted by the audio device and vice-versa. Providing hardware emulation for an audio source. Intermediation with OS when receiving audio to preserve sound quality. Connecting a host to a mobile phone to aid processing audio to enhance quality Adapting drivers to different audio source formats

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Interfacing to a peripheral in general	G06F 13/385
CODECs per se	G10L 19/16, G10L 19/24

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

CODEC coding/decoding, compression/decompression of an audio signal
---

## G06F 3/165

{Management of the audio stream, e.g. setting of volume, audio stream path}

#### **Definition statement**

This place covers:

Management from a host of the audio device by means of the interface control for modifying the operation of the audio device. Only for control of the audio device/system from the host. Controlling the audio settings such as volume, mute or filters. Controlling the audio stream path (switch output destination). Switch on or off of computer audio devices. Controlling the audio play, pause or replay.

## Relationships with other classification places

Dedicated to TV appliances: H04N 7/00

Network security protocols H04L 9/40

Control of speech to text/text to speech conversion: G10L 13/00 and G10L 15/00

# G06F 3/167

# {Audio in a user interface, e.g. using voice commands for navigating, audio feedback}

#### **Definition statement**

This place covers:

Interface to a computer user by means of an audio device to send commands to the computer or receive feed-back on an action. Limited to the navigation in a menu and sending control commands. Moving a mouse pointer on a screen using audio. Scrolling through a menu using audio. User interface of an audio card. Audio indicators to focus attention.

# Relationships with other classification places

User interaction and feedback in general: G06F 3/01

User interaction in a menu in general: G06F 3/048

Speech recognition per se: G10L 15/26, G10L 15/22

## G06F 5/00

# Methods or arrangements for data conversion without changing the order or content of the data handled

#### **Definition statement**

This place covers:

Data format conversions; Conversion between packed and unpacked BCD.

#### References

#### Informative references

Coding, decoding or code conversion, in general	<u>H03M</u>
Conversion of the form of the representation of individual digits	H03M 5/00
Code conversion	H03M 7/00
Parallel/series conversion	H03M 9/00

for shifting, e.g. justifying, scaling, normalising {(digital stores in which the information is moved stepwise, e.g. shift-registers <u>G11C 19/00</u>; digital stores in which the information circulates <u>G11C 21/00</u>)}

## **Definition statement**

This place covers:

Shifting which modifies the value being shifted, e.g. in arithmetic or for implementing shift instructions in processors; in particular the shifting functionality provided and the logic implementing it.

FIFOs of the types "shift-in, individual-out" or "individual-in, shift-out"	G06F 5/06
Partitioned buffers, e.g. allowing multiple independent queues, bidirectional FIFO's	G06F 5/065
Shift registers per se	G11C 19/00

## G06F 5/10

having a sequence of storage locations each being individually accessible for both enqueue and dequeue operations, e.g. using random access memory {(G06F 5/065 takes precedence)}

#### References

## Limiting references

This place does not cover:

Partitioned buffers, e.g. allowing multiple independent queues,	G06F 5/065
bidirectional FIFO's	

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Addressing methods of the memory	G06F 12/02, G11C 8/00

## G06F 5/12

Means for monitoring the fill level; Means for resolving contention, i.e. conflicts between simultaneous enqueue and dequeue operations

## **Definition statement**

This place covers:

E.g. signal generated / action taken before buffer runs full/empty.

# for overflow or underflow handling, e.g. full or empty flags

#### **Definition statement**

This place covers:

Signal generated / action taken when buffer is already full/empty.

## G06F 5/16

Multiplexed systems, i.e. using two or more similar devices which are alternately accessed for enqueue and dequeue operations, e.g. ping-pong buffers

### **Definition statement**

This place covers:

Alternating address by address, i.e. Odd-even.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Addressing methods of the memory

G06F 12/02, G11C 8/00

## G06F 7/00

Methods or arrangements for processing data by operating upon the order or content of the data handled (logic circuits H03K 19/00)

#### **Definition statement**

This place covers:

The methods and arrangements in this main group are one level above logic circuits.

Examples of such methods and arrangements are: arithmetic circuits implemented using basic logic gates, implementation of complex logic gates, and implementation at transistor level, specially designed for arithmetic operations.

Other examples are:

Logical operations on words per se;

Finite state machines:

Grey System Theory (method of handling uncertainty),

• Asynchronous digital pipeline = clock-less operation of logical operations.

### References

## Limiting references

This place does not cover:

Logic circuits, i.e. Implementation of basic logical circuits (AND, NAND,	H03K 19/00
OR, NOR, EXOR, EXNOR), at transistor level

# G06F 7/58

## Random or pseudo-random number generators

#### **Definition statement**

This place covers:

Generation or transformation of stochastic functions; generation of output with certain random characteristics; post processing, e.g. pattern elimination, whitening, reducing auto-correlation or bias; breakdown detection.

#### References

#### Informative references

Transformation of stochastic functions by table look-up	G06F 1/03
Lottery apparatus	G07C 15/00

Random pulse generators, random bit generators	H03K 3/84
Secret telegraphic communication	H04L 9/00

# **Special rules of classification**

Random bit generators: In case of a bit sequence, which could be seen as a random number sequence, classification is done both in the appropriate (sub)group in G06F 7/58 and in H03K 3/84.

Methods both valid for random and pseudo-random number generators should be classified in the head group (G06F 7/58) and not in a sub-group, even if a specific PRNG/RNG is discussed.

Double classification head group / main group only

- on basis of other aspects, e.g. possibly non-trivial PRNG or RNG also disclosed
- in case it is not sure that the method is valid for both RNG and PRNG

## Use of keywords

Pseudo-random number generators i.e. only deterministic PRNGs;mixed RNGs in G06F 7/588 if more than one type of pseudo- random number generator is discussed:- in case these PRNGs are clearly trivial: classify in head group ( G06F 7/582 ) - in case a PRNG might be non-trivial: classify in relevant sub-group(s)  Using finite field arithmetic, e.g. using a linear feedback shift registergenerators including the 2**n state with all zeroes in G06F 7/582  Random number generators, i.e. based on natural stochastic processes also mixed PRNG/RNGs Considered as random (G06F 7/588 ) are methods based on - radioactivity, zener, race, chaos- uncertain moment of pressing a key  Using non-contact-making devices, e.g. tube, solid state device; using unspecified devicese.g. 2's complementing  Using coordinate rotation digital computer (CORDIC)i.e. CORDIC in non-complex environment: G06F 7/5446  Using signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers and dividers often use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/538 and "recoded" or "Booth" multipliers in G06F 7/535 - G06F 7/538 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375.  Computations with numbers represented by a non-linear combination of denominational numbers, conversion to or from floating- point codes H03M 7/24) (G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/541, G06F 7/544 take precedence)e.g. fused multiply add (FMA) also here, but add G06F 7/5443  Logarithmic number system mainly for non-trivial operations such as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition  Dividingi.e. floating-point division		
registergenerators including the 2**n state with all zeroes in G06F 7/582  Random number generators, i.e. based on natural stochastic processes also mixed PRNG/RNGs Considered as random (G06F 7/588) are methods based on - radioactivity, zener, race, chaos- uncertain moment of pressing a key  Using non-contact-making devices, e.g. tube, solid state device; using unspecified devicese.g. 2's complementing  Using coordinate rotation digital computer (CORDIC)i.e. CORDIC in non-complex environment: G06F 7/5446  Using signed-digit representations internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375.  Computations with numbers represented by a non-linear combination of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) ( G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. floating-point of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition  G06F 7/485	PRNGs;mixed RNGs in G06F 7/588 if more than one type of pseudorandom number generator is discussed:- in case these PRNGs are clearly trivial: classify in head group (G06F 7/582) - in case a PRNG	G06F 7/582
also mixed PRNG/RNGs Considered as random (G06F 7/588) are methods based on - radioactivity, zener, race, chaos- uncertain moment of pressing a key  Using non-contact-making devices, e.g. tube, solid state device; using unspecified devicese.g. 2's complementing  Using coordinate rotation digital computer (CORDIC)i.e. CORDIC in non-complex environment: G06F 7/5446  Using signed-digit representationBinary multipliers and dividers often use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375.  Computations with numbers represented by a non-linear combination of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) (G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. fused multiply add (FMA) also here, but add G06F 7/5443  Logarithmic number system mainly for non-trivial operations such as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point G06F 7/485 addition		G06F 7/584
Using coordinate rotation digital computer (CORDIC)i.e. CORDIC in non-complex environment: G06F 7/5446  Using signed-digit representationBinary multipliers and dividers often use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375.  Computations with numbers represented by a non-linear combination of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) (G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. fused multiply add (FMA) also here, but add G06F 7/5443  Logarithmic number system mainly for non-trivial operations such as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition	also mixed PRNG/RNGs Considered as random (G06F 7/588) are methods based on - radioactivity, zener, race, chaos- uncertain moment	G06F 7/588
non-complex environment: G06F 7/5446  Using signed-digit representationBinary multipliers and dividers often use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375.  Computations with numbers represented by a non-linear combination of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) ( G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. fused multiply add (FMA) also here, but add G06F 7/5443  Logarithmic number system mainly for non-trivial operations such as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition		G06F 7/48
use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 - G06F 7/5375. of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) ( G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. fused multiply add (FMA) also here, but add G06F 7/5443  Logarithmic number system mainly for non-trivial operations such as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition	use signed-digit representation internally for one operand or the result; see therefor "recoded" or "Booth" multipliers in G06F 7/523 - G06F 7/5338 and "recoded" or "SRT" dividers in G06F 7/535 -	G06F 7/4824
as addition.multiplication of binary operands via the log-domain is in G06F 7/5235  Adding; Subtracting (G06F 7/4833 takes precedence)e.g. floating-point addition	of denominational numbers, e.g. rational number, logarithmic number system, floating-point numbers (conversion to or from floating-point codes H03M 7/24) (G06F 7/4806, G06F 7/4824, G06F 7/49, G06F 7/491, G06F 7/544 take precedence)e.g. fused multiply add	G06F 7/483
addition	as addition.multiplication of binary operands via the log-domain is in	G06F 7/4833
Dividingi.e. floating-point division G06F 7/4873		G06F 7/485
	Dividingi.e. floating-point division	G06F 7/4873

Multiplying i.e. floating-point multiplication If in fact only the mantissa- multiplication is treated, classification should be made in another group, unless special features for switching between fixed and floating point operands are described.	G06F 7/4876
Computations with a radix, other than binary, 8, 16 or decimal, e.g. ternary, negative or imaginary radices, mixed radix (non-linear PCM, G06F 7/4824 takes precedence) N-ary logic	G06F 7/49
Multiplying; Dividing MULTIPLICATION ONLY division goes into G06F 7/4915, whether it uses 8421 code or not	G06F 7/496
Mantissa overflow or underflow in handling floating-point numberse.g. exponent adjustment	G06F 7/49915
Normalisation mentioned as feature only i.e use of normalisationImplementation of floating-point normalisers: G06F 5/012	G06F 7/49936
Significance controli.e. number of significant bits	G06F 7/49942
Implementation of IEEE-754 StandardNote: The standard uses sign magnitude representation	G06F 7/49957
Rounding to nearest (G06F 7/49957 takes precedence) Note: The IEEE-754 way is "rounding to nearest even", which is rounds to nearest, and only when exactly in the middle to nearest even. Though rounding to nearest odd may in fact round to an even number, it normally doesn't.	G06F 7/49963
Rounding towards zero (G06F 7/49957 takes precedence)e.g. as in IEEE-754	G06F 7/49978
Rounding away from zeroway of rounding not provided for in IEEE-754	G06F 7/49984
Interval arithmetici.e. computations with intervals as values	G06F 7/49989
Adding; Subtracting ( <u>G06F 7/4806</u> , <u>G06F 7/4824</u> , <u>G06F 7/483</u> - <u>G06F 7/491</u> , <u>G06F 7/544</u> take precedence) only binary, radix 8, radix 16	G06F 7/50
using carry switching, i.e. the incoming carry is connected directly to the carry output under control of a carry propagate signal Full adders having in general the form1-bit adder stages (ripple carry)	G06F 7/503
with simultaneous carry generation for or propagation over two or more stages e.g. using group carry signals, e.g. carry skip; all smart carry schemes except carry look-ahead and carry select/ conditional sum are in G06F 7/506	G06F 7/506
using selection between two conditionally calculated carry or sum values e.g. carry select, conditional sum	<u>G06F 7/507</u>
for multiple operands, e.g. digital integrators i.e. operand-parallel addition of 3 or more operands (this is mainly "3" or "a lot");multipliers in G06F 7/52	G06F 7/509
word-serial, i.e. with an accumulator-registeri.e. OPERAND serial!	G06F 7/5095
Multiplying; Dividing (G06F 7/4806, G06F 7/4824, G06F 7/483 - G06F 7/491, G06F 7/544 take precedence) very rare cases only; normally documents are classified in one of the subgroups (or both) This subgroup does not cover G06F 7/5443: multiplier-accumulators (f = $\sum$ $a_i x_i$ ), including simple cases f = $ax + b$ , f = $ax + by$ G06F15/347: vector multipliers, matrix multipliers G06F 7/68: binary rate multipliers/dividers G06F 7/724: finite field multipliers	G06F 7/52

In serial-parallel fashion, i.e. one operand being entered serially and the other in parallel (G06F 7/533 takes precedence) In old documents these multipliers are often called "parallel", in newer documents they are often called "serial"!	G06F 7/527
with row-wise addition of partial products i.e. adding two rows each cycleIn majority: "add to accumulator and shift"	G06F 7/5272
In parallel-parallel fashion, i.e. both operands being entered in parallel (G06F 7/533 takes precedence) e.g. single cells for cellular array multiplierse.g. arrays of undetermined type	G06F 7/53
Using indirect methods, e.g. quarter-square method, via logarithmic domainif operands stay in the log-domain then G06F 7/4833 ;quarter-square see XP013079891	G06F 7/5235
in serial-serial fashion, i.e. both operands are entered serially (G06F 7/533 takes precedence) e.g. Lyon multipliers (see XP007901470)	G06F 7/525
with row-wise addition of partial productsi.e. adding two rows each cycle	G06F 7/5272
with column-wise addition of partial productse.g. adding one column each cycle with a parallel counter	G06F 7/5277
In parallel-parallel fashion, i.e. both operands being entered in parallel (G06F 7/533 takes precedence) e.g. single cells for cellular array multipliers; e.g. arrays of undetermined type	G06F 7/53
With row-wise addition of partial products (G06F 7/5324 takes precedence) cellular array multipliers with ripple carry (=within rows) also skewed arrays of the type "McCanny & McWhirter"e.g. linear chain of cascaded adders	G06F 7/5306
With column-wise addition of partial products, e.g. using Wallace tree, Dadda counters (G06F 7/5324 takes precedence)e.g. adder trees	G06F 7/5318
Partitioned, i.e. using repetitively a smaller parallel-parallel multiplier or using an array of such smaller multipliers each smaller multiplier larger than 1 bit; multiprecision; also array multipliers A) n × m bit multiplier consisting of an array of k × l multipliers, k being a submultiple of n and l being a submultiple of m respectively, followed by an array or tree of adders, e.g. of Wallace type. B) n × m bit multiplication realised by a single k × l multiplier, k and l as above, used repetitively and followed by an accumulator. The k × l bit multipliers may be single ROM's for example. Not to be confused with multi-bit-scanning, where a selection among precalculated multiples of the multiplicand is made; if the k × l bit multipliers itself are of the latter type, double classification may be appropriate.	G06F 7/5324
Reduction of the number of iteration steps or stages, e.g. using the Booth algorithm, log-sum, odd-even for Booth, use the subgroups! Note: the term "Booth" is often incorrectly used when intending to say "modified Booth". A Booth recoder module inputs some, e.g. two, consecutive bits and sends a 'Booth carry' to a more significant module. A modified Booth recoder module inputs some, at least three, consecutive bits, the most significant of which is also input to the next higher recoder module. In modified Booth the recoder modules are not connected to each other via a carry.	G06F 7/533
By skipping over strings of zeroes or ones, e.g. using the Booth Algorithme.g. using operand processing, e.g. simple (radix-2, 1st order) Booth, also canonical recoding to NAF form (sequential recoding with carry)	G06F 7/5332

By using multiple-bit-scanning, i.e. by decoding groups of successive multiplier bits in order to select an appropriate pre-calculated multiple of the multiplicand as a partial product i.e. processing multiple bits per iteration (radix > 2) without overlap, e.g. using positive precalculated multiples only groups of MR-bits are decoded for selecting multiples of MD e.g. 2-bit groups: 3-bit groups: 00 0 x MD 000 0 x MD 01 1 x MD 001 1 x MD 10 2 x MD 010 2 x MD 11 3 x MD 100 4 x MD 101 5 x MD 110 6 x MD 111 7 x MDMultiples,that are not a power of 2(3x,7x, etc)have to be precalcultated or looked up in a table.	G06F 7/5334
Each bitgroup having two new bits, e.g. 2nd order MBAi.e. radix-4 modified Booth, i.e. 2nd order modified Booth	G06F 7/5338
Reduction of the number of iteration steps or stages, e.g. using the Sweeny-Robertson-Tocher (SRT) algorithm (not used, see <u>G06F 7/535</u> or <u>G06F 7/5375</u> )NOT USED, non-restoring in general gets the KW non-restoring,SRT in particular goes in <u>G06F 7/5375</u>	G06F 7/537
Non restoring calculation, where each digit is either negative, zero or positive, e.g. SRT; (WARNING Not complete. Provisionally see G06F 7/535 + G06F 7/5375) almost empty - everything is in Indexing Code G06F 7/5375	G06F 7/5375
For evaluating functions by calculation (with a look-up table G06F 17/10; complex mathematical operations G06F 17/10; G06F 7/4806, G06F 7/4824 take precedence) e.g. min, max of two operands, absolute value, (sum of) absolute differencefinding a maximum value of a set (e.g. during sorting) is in G06F 7/22; direct table lookup of function values is in G06F 1/03; table lookup of coefficients during computation goes here, put "table lookup" in the TXT field;	G06F 7/544
Sum of products (for applications thereof, see the relevant places, e.g. G06F 17/10, H03H 17/00) e.g. MACs; fused multiply add (FMA) for floating point are in G06F 7/483 with G06F 7/5443	G06F 7/5443
using crossaddition algorithms, e.g. CORDIC e.g. sin, cos, tan, sinh, cosh, tanh;CORDIC on complex numbers: G06F 7/4818	G06F 7/5446
Powers or roots, e.g. Pythagorean sumse.g. powers by multiplying the operand by itself (which is not possible with non-integer powers)	G06F 7/552
Arithmetic logic units (ALU), i.e. arrangements or devices for performing two or more of the operations covered by groups G06F 7/483-G06F 7/556 or for performing logical operations (instruction execution G06F 9/30; G06F 7/49, G06F 7/491 take precedence; logic gate circuits H03K 19/00)e.g. arrangements for performing more than one operation using the same circuitry	G06F 7/57
Basic arithmetic logic units, i.e. devices selectable to perform either addition, subtraction or one of several logical operations, using, at least partially, the same circuitry: Note: multiplication is not seen as "basic"	G06F 7/575

## G06F 7/60

Methods or arrangements for performing computations using a digital non-denominational number representation, i.e. number representation without radix; Computing devices using combinations of denominational and non-denominational quantity representations {, e.g. using difunction pulse trains, STEELE computers, phase computers (conversion of digital data to or from non-denominational form H03M 5/00, H03M 7/00)}

#### **Definition statement**

This place covers:

For example, documents concerning

- · "permutograph";
- a "Negationsnetz";

Fibonacci code representation. Further details of subgroups

#### G06F 7/602:

using difunction pulse trains (STEELE computers); phase computers (GAINES). e.g. Delta-Sigma sequences.

#### G06F 7/607:

number-of-ones counters, i.e. devices for counting the number of input lines set to ONE among a plurality of input lines, also called bit counters or parallel counters (for applications thereof, see the relevant places, e.g. G06F 7/49, G06F 7/5013, G06F 7/509, H03M 1/00, H03M 7/20)

e.g. number of ones counters (parallel counters), compressors, carry save adders 4-2, 7-3, etc, e.g. used in multipliers.

#### G06F 7/64:

Digital differential analysers, i.e. computing devices for differentiation, integration or solving differential or integral equations, using pulses representing increments; Other incremental computing devices for solving difference equations (G06F 7/70 takes precedence; differential analysers using hybrid computing techniques G06J 1/02) DDA application in numerical control G05B 19/18. Integration per se: G06F 17/10.

#### G06F 7/68:

Using pulse rate multipliers or dividers pulse rate multipliers or dividers per se (<u>G06F 7/70</u> takes precedence) (frequency division in electronic watches <u>G04G 3/02</u>; frequency multiplication or division in oscillators H03B 19/00; frequency dividing counters per se H03K 23/00 - H03K 29/00)

e.g. phased locked loop (PLL) with digital divider (thus achieving pulse rate multiplication); PLLs in general are in <u>H03L 7/06</u>;

pulse rate doubling by adding delayed pulses and correcting the duty cycle are in <u>H03K 5/1565</u>; <u>H03K 23/00</u> - <u>H03K 29/00</u> mostly relate to analogue aspects.

#### References

## Limiting references

This place does not cover:

Conversion of digital data to or from non-denominational form	H03M 5/00, H03M 7/00

## G06F 7/72

# using residue arithmetic

## **Definition statement**

This place covers:

A mod N, modulo addition, modulo subtraction

Further details of groups

#### G06F 7/721:

Covers for e.g. modular division; both with composite moduli and in prime number fields.

#### G06F 7/723:

This subgroup covers RSA [Rivest–Shamir–Adleman ] cryptosystem in general.

#### G06F 7/724:

Covers mainly (binary) extension fields; prime number fields using modular arithmetic are covered in  $\underline{\text{G06F 7/72}}$  -  $\underline{\text{G06F 7/723}}$ ,  $\underline{\text{G06F 7/727}}$  and  $\underline{\text{G06F 7/728}}$ .

For this type of arithmetic the term "Galois field" and symbols of the type GF(p<sup>n</sup>) are characteristic, e.g. GF(2<sup>4</sup>).

## G06F 7/725:

Elliptic curve cryptography [ECC] is classified in this subgroup only if specific adaptations for elliptic curves are present.

#### G06F 7/726

This subgroup covers rational functions p(x)/q(x) for example and inversion in extension fields is covered in G06F 7/726.

## G06F 7/728

Montgomery reduction involves adding of multiples of the modulo, followed by right shifting.

#### G06F 7/729

This subgroup covers the Chinese Remainder Theorem for non-RSA for example.

A residue number system (RNS) is a system in which a number is represented by a series of digits, each of which is the remainder of that number with respect to a different modulus m<sub>i</sub>:

e.g.: moduli -> 5 3 2

 $26_{10} = 120$ 

The maximum number representable is  $M = (\prod_i m_i) - 1$ 

e.g.:  $(2 \times 3 \times 5) - 1 = 29$  in the above case.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Error detection/correction in computers	G06F 11/00
Optical residue arithmetic devices	G06E 1/065
Error detection/correction for coding in general	H03M 13/00
Error detection/correction in transmission	H04L 1/00
Secret communication	H04L 9/00

## G06F 7/74

Selecting or encoding within a word the position of one or more bits having a specified value, e.g. most or least significant one or zero detection, priority encoders {(with shifting G06F 5/01)}

## **Definition statement**

This place covers:

E.g. leading zero anticipation LZA, priority encoders.

With shifting (during/for detection) details: also in G06F 5/01.

#### References

## Limiting references

This place does not cover:

with shifting	<u>G06F 5/01</u>
---------------	------------------

# G06F 7/76

Arrangements for rearranging, permuting or selecting data according to predetermined rules, independently of the content of the data

## **Definition statement**

This place covers:

For example, masking, shuffling

G06F 7/766 covers i.e. serial or parallel generation of all permutations.

G06F 7/768 covers e.g. endian conversion.

## Relationships with other classification places

Boolean masking in block or stream ciphers is covered by H04L 2209/04.

Endian conversion by memory addressing is covered by G06F 12/04.

Bus coupling with endian conversion and endian conversion instruction are covered by G06F 13/4013.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Arrangements for rearranging, permuting or selecting data according to the content of the data	G06F 7/06, G06F 7/22
Parallel / series conversion or vice versa	H03M 9/00

# G06F 7/78

for changing the order of data flow, e.g. matrix transposition or LIFO buffers; Overflow or underflow handling therefor

## **Definition statement**

This place covers:

LIFO [Last In, First Out], also called stack or pushdown store:

- · Reversal of a train of data words.
- · Reversal of a train of data bits.

Devices called FIFO [First In, First Out], but having possibilities to extract also other data items than the first one.

Matrix transportation devices.

Other devices with an output sequence different from the input sequence, but independent of the contents of the data.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

FIFO-devices	G06F 5/06
Reordering based on contents of data, e.g. sort key	G06F 7/22
Cache-memories	G06F 12/08
FIFO with priority-controlled output	G06F 13/18

## G06F 8/00

Arrangements for software engineering (testing or debugging G06F 11/36; administrative, planning or organisation aspects of software project management G06Q 10/06)

## **Definition statement**

This place covers:

The engineering discipline of creating software and the assistance of computer tools (CASE tools) in exercising the task of software engineering.

The phases, covered by <u>G06F 8/00</u>, range from the initial requirements collection up to and including the delivery of software to the end user, its maintenance and management but exclude the phase of testing and debugging.

# Relationships with other classification places

Aspects of the particular application of the software being designed, e.g. commercial or financial software, are classified in the appropriate place.

## References

# Limiting references

This place does not cover:

Testing or debugging	G06F 11/36
Administrative, planning or organisation aspects of software project management	G06Q 10/06

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Execution of a stored program	G06F 9/06
Hardware/software co-design	<u>G06F 30/00</u>

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

CASE	Computer-Aided Software Engineering

# G06F 8/10

# Requirements analysis; Specification techniques

## **Definition statement**

This place covers:

Capturing and formalising user requirements:

- · Graph notations;
- Diagramming techniques, e.g. Dataflow diagrams;
- · Requirements specifications;
- · Use of modelling languages such as uml;
- · Petri nets.

Query generation in information retrieval	G06F 16/33, G06F 16/24

# G06F 8/31

# {Programming languages or programming paradigms}

## **Definition statement**

This place covers:

Programming languages and paradigms that can be used by a programmer in order to create source code.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Processing or translation of natural language	G06F 40/40
---	------------

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

HLL	High Level Language
-----	---------------------

# {Functional or applicative languages; Rewrite languages}

## **Definition statement**

This place covers:

Languages designed for functional programming that treats computation as the evaluation of mathematical functions. Examples are Sasl, Miranda and Haskell.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Functional programming	software development model which expresses algorithms as functions, i.e. as stateless mappings of input values to output values
Declarative programming	programming paradigm that expresses a computation without describing its control flow

# G06F 8/312

# {List processing, e.g. LISP programming language}

## **Definition statement**

This place covers:

List processing languages, e.g. Lisp and Scheme.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

CAR	Function that determines the first element of a list
CDR	Function that determines the list after its first element

# G06F 8/313

# {Logic programming, e.g. PROLOG programming language}

## **Definition statement**

This place covers:

Programming languages expressing a program as a collection of logical statements.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	programming paradigm that expresses a computation without describing its control flow
Horn clause	logical statement

# {Unification or backtracking}

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Unification	finding an assignment that satisfies all clauses
_	done on partial unifications that cannot succeed, and to continue to find more possible unifications

# G06F 8/314

# {Parallel programming languages (G06F 8/313 takes precedence)}

## **Definition statement**

This place covers:

Programming languages having constructs for expressing parallelism, e.g. Occam.

## References

## Limiting references

This place does not cover:

Parallel logic programming	G06F 8/313
Detecting and extracting parallelism from program code	<u>G06F 8/456</u>

# G06F 8/315

# {Object-oriented languages}

#### **Definition statement**

This place covers:

Programming languages expressing algorithms as interacting objects, where an object is an aggregation of data (attributes) and actions (methods).

Examples of object oriented languages are Smalltalk, Ruby, Eiffel, C++, C#, Java, Oberon, Modula.

In this place, the following terms or expressions are used with the meaning indicated:

Method	the action to be performed on (attributes of) an object
--------	---

## G06F 8/316

## {Aspect-oriented programming techniques}

## **Definition statement**

This place covers:

Programming paradigm allowing different, orthogonal, aspects of a program (business rules, security, fault tolerance, data consistency) to be designed independently and to be merged later to produce a final source code product.

Aspect-Oriented Software Development foresees a full and independent design for all the secondary aspects of an application like security, persistency, synchronization, logging, etc., carried out at the same time as the design of the core functionality of the application.

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Aspect Weaving	the process of merging the different aspects
Join Points	the actual places in the program where the aspects are merged

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

AOSD	Aspect oriented software development
------	--------------------------------------

## G06F 8/33

# Intelligent editors

# **Definition statement**

This place covers:

Intelligent editors that help a programmer to write programs, e.g. language-sensitive editors.

#### Examples:

- Proposing a closing bracket when an opening bracket is typed.
- · Indenting of if-then-else statements.
- Verification of entered text (e.g. whether variables are already declared).

#### References

#### Informative references

Text processing	G06F 40/10
-----------------	------------

# **Graphical or visual programming**

## **Definition statement**

This place covers:

P programming techniques whereby a program is created by handling graphical programming objects representing programming constructs/statements rather than writing program text.

# G06F 8/35

## model driven

## **Definition statement**

This place covers:

Automatically generating program code (source code) from a specification/definition/model of what the program should do.

Typical examples: WO0108007, WO02086704, EP0737918, WO0177882.

Specific topics included:

- Generating a debugger from a formal specification: EP1071016;
- Generation of source code for web applications: WO0171566;
- Convert spreadsheet data into source code: US2003106040, US2004064470;
- Generate source code from XML: US2003167444;
- Generate a shader program from a graphics file: US2003179220;
- OMG's Model driven architecture (MDA).

## **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

MDSD	Model driven software development
MDA	Model driven architecture

# {Round-trip engineering}

## **Definition statement**

This place covers:

Arrangement for keeping a model and the corresponding program code in sync when applying changes to any of them.

## G06F 8/36

## Software reuse

#### **Definition statement**

This place covers:

- Storing and retrieving reusable software modules into and from software repositories;
- Building, searching and maintaining software repositories containing reusable software parts;
- Managing repositories of software components, objects;
- Storing software components into a repository, thereby indicating additional information about the components, e.g. the function performed, what inputs are required, what outputs are generated;
- Querying the repository to retrieve components that satisfy the particular requirements, e.g. related to its function;
- Detecting program parts that are candidates for reuse;
- · Design patterns.
- Using APIs and interfaces, e.g. for components, to make software reusable.

## **Definition statement**

This place covers:

Processing language-external elements, e.g. compiler directives, macro definitions and macro expansions, and inclusion of library source files.

# G06F 8/425

# {Lexical analysis}

## **Definition statement**

This place covers:

Converting sequences of characters into tokens, skipping comments.

# G06F 8/427

# {Parsing}

## **Definition statement**

This place covers:

Checking for correct syntax and building a data structure, e.g. parse tree.

Multibox parsers.

## References

## Informative references

Parser generators	G06F 8/37
Parsing markup language streams	G06F 40/221

# {Checking; Contextual analysis}

## **Definition statement**

This place covers:

Checking context-senstive conditions, e.g. whether variables have been declared.

## G06F 8/433

# {Dependency analysis; Data or control flow analysis}

## **Definition statement**

This place covers:

Determining the dependencies between different program parts (e.g. data dependencies, which variables/values are used in expressions, and control dependencies, which statements have influence on other statements), in particular to determine whether such program parts should be placed in a certain order.

# G06F 8/434

## {Pointers; Aliasing}

# **Definition statement**

This place covers:

Determining whether references, e.g. pointers, reference variables and indexed array elements, actually refer to the same underlying memory element.

## G06F 8/436

# {Semantic checking}

## **Definition statement**

This place covers:

Checking semantic conditions which can be determined without actual execution of the program, e.g. whether variables are initialized.

## G06F 8/437

# {Type checking}

## **Definition statement**

This place covers:

Checking type compatibility of values, variables, parameters and expressions.

# {Encoding}

## **Definition statement**

This place covers:

Generating an executable implementation of the program for the target machine architecture, usually via an internal form that is independent of the source programming language and that is also independent of the target machine architecture.

## G06F 8/441

# {Register allocation; Assignment of physical memory space to logical memory space}

## **Definition statement**

This place covers:

Assigning logical registers to variables, assigning physical register to logical registers, coalescing, spilling.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Coalescing	removing useless copy instructions from a program. This needs
	information about assigned registers and therefore it is commonly
	performed as a subtask of register allocation besides spilling and
	register assignment.

# G06F 8/443

# {Optimisation}

# **Definition statement**

This place covers:

Optimisation of the program code; the program code can take any form e.g. source code, assembly code, machine code.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Code refactoring	G06F 8/72
------------------	-----------

# Special rules of classification

Whenever an optimisation concerns speed, size, etc, such documents should be classified in the corresponding subgroups. In this group should be classified only special optimision techniques not present in any of the subgroups.

Contains optimizations that do not involve a trade off between different	G06F 8/443
factors (speed, size, energy consumption	

## G06F 8/443 (continued)

Special rules of classification

Involve a trade-off. They are specifically aimed to optimize one aspect,	G06F 8/4432,
likely at the cost of another aspect.	G06F 8/4434,
	G06F 8/4441

## G06F 8/4432

# {Reducing the energy consumption}

## **Definition statement**

This place covers:

Optimisation methods specifically aimed at reducing the energy consumption of program code.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Means for Saving Power, Power Management strategies	G06F 1/3203
---	-------------

# G06F 8/4434

# {Reducing the memory space required by the program code}

#### **Definition statement**

This place covers:

Optimisation methods specifically aimed at reducing the size of the program code, e.g. by replacing sequences of recurring instructions with a new macro instruction/superinstruction. Requires that the target architecture/virtual machine recognize this new instruction; Cross jumping; Tail Merging.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Data compression (e.g. PKZIP)	<u>H03M 7/30</u>
-------------------------------	------------------

# Special rules of classification

Note that this group does not cover the compression of program code, which requires a decompression before it can be executed. Compression of program code in this sense does not result in the actual program being smaller; there is only a saving in the secondary storage or transmission via the network.

In contrast, the size-reduced code covered by this group is directly executable, so no decompression is needed before execution.

# {Detection or removal of dead or redundant code}

## **Definition statement**

This place covers:

Detecting and removing of dead or redundant code. Redundancy elimination optimizations avoid repeated computation of the same value by computing the value once, saving it in a temporary variable, and reusing the value from the temporary variable when it is needed again. Examples of redundancy elimination optimizations include common subexpression elimination, loop invariant code motion and partial redundancy elimination.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Dead code	code that is never executed or that is unreachable.
	code that produces results that are never used or are irrelevant to the program execution or code that computes values that were already computed before.

## G06F 8/4436

# {Exlining; Procedural abstraction}

## **Definition statement**

This place covers:

Detecting recurring sequences of instructions and replacing each of them with a call to a procedure/function that contains those instructions.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Reuse, i.e. identifying recurring pieces of code for purposes of reuse	G06F 8/36
Inlining	G06F 8/4443
Code clone detection, i.e. detection of identical pieces of code for the purpose of maintenance	G06F 8/751
Plagiarism detection in a source code	G06F 21/10

## G06F 8/4441

# {Reducing the execution time required by the program code}

## **Definition statement**

This place covers:

Optimisation methods specifically aimed at improving the execution speed of the program.

# {Reducing the number of cache misses; Data prefetching (cache prefetching G06F 12/0862)}

#### **Definition statement**

This place covers:

Avoiding cache misses at run-time. Cache can be instruction or data cache.

Splitting a program into frequently used and not frequently used parts (hot and cold parts) and keeping the hot parts in the cache.

Rearranging the individual instructions in order to have data/instructions present in the cache when they are needed.

## References

Exlining	G06F 8/4436

## G06F 8/445

{Exploiting fine grain parallelism, i.e. parallelism at instruction level (run-time instruction scheduling G06F 9/3836)}

# **Definition statement**

This place covers:

Increasing the Instruction Level Parallelism (ILP) that can be exploited by the hardware at run-time (pipelines, superscalar processors executing multiple instruction streams). Typically this is done by reordering the instructions (scheduling).

## Limiting references

This place does not cover:

Exploiting coarse grain parallelism	G06F 8/45
Run-time scheduling or reordering of instructions by the hardware	G06F 9/3836
Process scheduling	G06F 9/4881

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Scheduling	reordering of instructions

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

ILP	Instruction Level Parallelism
-----	-------------------------------

# G06F 8/4451

# {Avoiding pipeline stalls}

## **Definition statement**

This place covers:

Reducing or avoiding run-time pipeline stalls.

Pipeline stalls (or bubbles) are caused by control hazards – e.g. branches -, data hazards -one instruction depends on the result of another instruction and must wait for this instruction to finish-or resource hazards -there are not enough resources to serve all the instructions currently in flight - instructions must wait for resources to be freed in order to be fed to the pipeline. Control Hazards can handled by static branch-prediction, speculative execution or delayed branch. Data Hazards can be avoided by rearranging the instructions so that instructions that depend on each other's result are farther separated.

In a pipeline, there is only one instruction stream. So the parallelism consists in the overlapping of the instructions of the stream rather than executing the instructions of 2 streams simultaneously.

## References

# Informative references

Hardware aspects of pipelining	G06F 9/38

# {Software pipelining}

## **Definition statement**

This place covers:

Software pipelining, e.g. Modulo Scheduling, transforms a loop described in a high-level programming language, such as C or FORTRAN, in such a way that the execution of successive iterations of the loop are overlapped rather than sequential. This technique exposes the instruction level parallelism (ILP) available between successive loop iterations to the compiler and to the processor executing the transformed code.

## G06F 8/49

# {Partial evaluation}

## **Definition statement**

This place covers:

Specializing a program for some or all of its possible input values.

#### Different flavours are:

- "normal" PE (partial evaluation): specialize program for certain values of its inputs
- "predictive" PE: predict the run-time values of some inputs and specialize the program accordingly. At run-time, check if the prediction was correct. If yes, execute it. If no, recompile using the actual values.
- "multi-version" PE: generate multiple specialized versions of the program corresponding to different inputs. At run-time choose the appropriate version.
- "placeholder" PE: specialize the program for the known inputs. For the unknown inputs, provide placeholders, that will be filled in at run-time.

## Installation

## **Definition statement**

This place covers:

- · First-time installation of software.
- Unattended installation, installation scripts (answer file).
- Installation packages (containing list of files, program image, files itself, install/update instructions).
- · Network installation plans.
- Type of installations.
- Silent installation no display of the progress of the installation.
- Unattended installation installation performed without user interaction.
- Self installation unattended installation without the need of initial launch of the process.
- Headless installation installation performed without using a monitor connected to the destination computer.
- Clean installation cleaning up a destination partition (formatting) before actual installation.
- Flat installation first copying installation files from a media to a hard disk and then installing them from the hard drive.
- Network installation installation of a program from a shared network drive.
- Virtual installation performing a virtual installation to check for errors before committing the real installation.

# Incremental updates; Differential updates

#### **Definition statement**

This place covers:

Update methods explicitly demonstrating how a new version of software is created from an old version and update instructions and/or differential data. The simplest way to update a piece of software from a first version to a second version is to remove the first version in its entirety and replace it by the entire second version. This method, although conceptually simple, is highly inefficient, especially in the case where the second version differs only slightly from the first version:

- It is always necessary to provide the target with the entire second version; if a network is involved, this puts a high burden on the network
- It might take a long time to perform the update because the entire first version has to be deleted and the entire second version has to be written.

This group tackles this problem in that the update is performed by using the existing instance of the first version as a basis and to generate the instance of the second version therefrom. The scope of the group can thus be described as dealing with the details of how to modify an existing instance of the first version in order to arrive at the second version.

Typically, the second version is created by only changing those parts of the first version that actually change. This can be accomplished by creating a difference file (delta) that describes the differences of the second version with regards to the first version. The delta is provided to the target and applied to the first version thus yielding the second version. This delta can be passive - the delta is applied by an updater - or active -the delta contains instructions to actually perform the update.

Incremental update more generally refers to details of the steps involved to convert one piece of software into another. Differential update is more specific and explicitly uses differences between the two pieces of software.

## G06F 8/66

## {of program code stored in read-only memory [ROM]}

## **Definition statement**

This place covers:

Updating software that is stored in non-alterable ROM.

## Software maintenance or management

## **Definition statement**

This place covers:

- Adapting the code of a program in response to new requirements, changes to the environment, detection of bugs, etc.
- When new functionality is required, analysing the code in order to find the points to edit; generating new code, and incorporating it into the application

# G06F 8/71

# Version control (security arrangements therefor <u>G06F 21/57</u>); Configuration management

## **Definition statement**

This place covers:

Version control, administering version numbers and releases. Deals with the problem of managing a modular software system: keeping track of the changes and the different version of the modules, the interrelation between the modules, the effects of the changes of one module on the other modules, the problem of multiple users editing different modules.

Includes in particular:

- · Make, Build
- Analysing changes to/conflicts between sources
- · SCCS-like tools
- Dependency analysis
- Comparing/obtaining dates of last changes of sources/intermediates/targets;
- CVS Concurrent Version Control, SVN, GIT, ...

### G06F 8/72

# **Code refactoring**

#### **Definition statement**

This place covers:

Applying any change to a computer program's code which improves its readability or simplifies its structure without changing its results. In software engineering, "refactoring" a source code module often means modifying the module without changing its external behavior, and is sometimes informally referred to as "cleaning it up".

Code refactoring can be considered the design-time equivalent of code optimization (<u>G06F 8/443</u>). Code refactoring is concerned with improving the structure of the code in view of easier maintenance whereas code optimization is concerned to make the code better for a particular aspect (speed, size, energy).

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	the process of changing software such that the changes do not alter the external behavior of the code, yet improve the internal code structure
Re-engineering	In contrast to reverse engineering

### G06F 8/73

### **Program documentation**

### **Definition statement**

This place covers:

Augmenting program code with additional information in order to increase its understandability in view of easier maintenance.

Documenting program code, inserting comments in source code.

### G06F 8/74

### Reverse engineering; Extracting design information from source code

#### **Definition statement**

This place covers:

Reverse engineering of HLL source code to its underlying design, model.

# Structural analysis for program understanding

# **Definition statement**

This place covers:

Static analysis of the structure of program code.

# References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Analysing program code in order to identify reusable program parts	G06F 8/36
Monitoring program code execution	G06F 11/34

### G06F 8/751

# {Code clone detection}

### **Definition statement**

This place covers:

Detecting code clones, e.g. introduced as a result of copy & paste by the programmer.

#### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Reuse, i.e. identifying recurring pieces of code for purposes of reuse	G06F 8/36
Exlining, i.e. finding similar sequences of code to replace them with a procedure invocation	G06F 8/4436
Plagiarism detection for source code	G06F 21/10

# G06F 8/76

# Adapting program code to run in a different environment; Porting

### **Definition statement**

This place covers:

Adapting program code to run in a different environment, i.e. a different architecture or operating system.

### G06F 8/77

### Software metrics

### **Definition statement**

This place covers:

Measurement of software metrics related to a software development project, such as product metrics and process metrics.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Measuring certain characteristics of a program in view of debugging	G06F 11/362
---	-------------

# Special rules of classification

Not to be confused with  $\underline{\text{G06F }11/362}$ , which deals with measuring certain characteristics of a program in view of debugging.

### G06F 8/78

# {Methods to solve the "Year 2000" [Y2K] problem}

### **Definition statement**

This place covers:

The Year 2000 problem, i.e. adapting software so as to comply with a not-foreseen date format.

### Synonyms and Keywords

In patent documents, the following abbreviations are often used:

Y2K	Year 2000

# G06F 9/00

# Arrangements for program control, e.g. control units (program control for peripheral devices G06F 13/10)

# **Definition statement**

This place covers:

Program control for general purpose computers.

Runtime execution of programs.

### References

### Limiting references

This place does not cover:

ogram control for peripheral devices	G06F 13/10
--------------------------------------	------------

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Arrangements for development of programs; Software engineering	G06F 8/00
Program control in regulating or control systems	<u>G05B</u>

# Special rules of classification

Note for use of these definitions:

In the sub-groups of G06F 9/00 there are rules of classification which differ from the rules of the IPC, and are specified in this section.

The sub-groups mentioned under "Informative references"; "Limiting references" and "Relationship between large subject matter areas" are to be taken as indicators as to where the document to be classified may be forwarded or circulated for classifying.

Specific combinations or conventions of classification are mentioned under "Special rules of classification".

# G06F 9/02

### using wired connections, e.g. plugboards

# Special rules of classification

Not currently used, as old technology.

### G06F 9/04

# using record carriers containing only program instructions (G06F 9/06 takes precedence)

### References

#### Limiting references

This place does not cover:

Arrangements for program control using storeddevelopment of programs;	G06F 9/06
Software engineering	

### Special rules of classification

Not currently used, as old technology.

### G06F 9/06

using stored programs, i.e. using an internal store of processing equipment to receive or retain programs

### **Definition statement**

This place covers:

Programming arrangements for computers having a stored program. Covers execution of stored programs, and arrangements therefor.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Program control for machine tools using a digital processor	G05B 19/042
---	-------------

### G06F 9/22

# Microcontrol or microprogram arrangements

### **Definition statement**

This place covers:

Arrangements for executing microcode in general.

A next instruction of the program, when fetched from program store, is translated into lower level microinstructions, usually by using the instruction to index into a microprogram or control memory to fetch a series of microinstructions which are then decoded to obtain control signals to carry out the function of the machine instruction.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Execution of machine instructions	G06F 9/30
-----------------------------------	-----------

# Special rules of classification

Precedence and classification rules:

The classification rules for subgroups  $\underline{G06F9/22}$  -  $\underline{G06F9/28}$  is different from those used in  $\underline{G06F9/30}$  and subgroups.

All aspects disclosed in a document which are deemed useful for search receive a class, not just the subject matter of the invention. Hence multiple subgroups are to be used.

There is no distinction made between invention and additional subject matter, and the classes for additional subject matter are not used.

A single lower level group is given if appropriate. A higher level group is given for documents having features belonging to multiple subgroups.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Microprogram	internal set of instructions used to translate a machine instruct of the stored program into a series of control signals. The microprogram is usually fixed at runtime, and defines the operations of the processor. Changing the microprogram char the functionality of the processor, i.e. what type of operations i carry out, and how these are carried out.	
Nanoinstructions	instructions of a level lower than microinstructions i.e. multiple nanoinstructions are used to execute a microinstruction.	

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

• "microprogram", "microcode", "firmware" and "microinstructions"

### G06F 9/223

{Execution means for microinstructions irrespective of the microinstruction function, e.g. decoding of microinstructions and nanoinstructions; timing of microinstructions; programmable logic arrays; delays and fan-out problems}

#### **Definition statement**

This place covers:

Microinstruction execution aspects independent of the type of microinstruction, e.g. decoding of microinstructions; timing.

Includes PLAs used as sequencers for microcode.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

• "PLA" and "Programmable Logic Array"

# G06F 9/226

{Microinstruction function, e.g. input/output microinstruction; diagnostic microinstruction; microinstruction format}

### **Definition statement**

This place covers:

Specific types of microinstruction operations.

Microinstruction set, microinstruction format.

### G06F 9/24

# Loading of the microprogram

### **Definition statement**

This place covers:

- · Loading of microcode implying altering the processor functionality;
- Changing the processor operations by loading or modifying microcode in the control store, thereby altering the way in which instructions are implemented in microcode;
- Fetching control microcode from ROM into RAM for execution;
- Patching by loading new microcode. Usually implemented by substituting the microcode at a particular instruction address in the microstore by a correct version during instruction fetching.

### Relationships with other classification places

Loading of operating system or application programs; loading of new versions of software G06F 9/445.

Address formation of the next micro-instruction (G06F 9/28 takes precedence){; Microprogram storage or retrieval arrangements}

#### **Definition statement**

This place covers:

- · microinstruction addressing arrangements;
- sequencers for microcode;
- microinstruction storage, and microinstruction retrieval or fetching.

#### References

### Limiting references

This place does not cover:

Enhancement of operational speed, e.g. by using several microcontrol	G06F 9/28
devices operating in parallel	

# Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

• "microinstruction" and "microinstruction" or "microprogram" and "microprogram"

# G06F 9/261

# {Microinstruction address formation}

### **Definition statement**

This place covers:

Formation of the microinstruction address e.g. using lookup table.

### G06F 9/262

# {Arrangements for next microinstruction selection}

### **Definition statement**

This place covers:

Retrieval of the next microinstruction

# G06F 9/264

### {Microinstruction selection based on results of processing}

# **Definition statement**

This place covers:

Address formation of the next microinstruction by selection according to the results of processing.

Next microaddress or microinstruction derived directly from the program flow, e.g. program counter, branch.

# {by address selection on input of storage}

### **Definition statement**

This place covers:

Address formation of the next microinstruction by selection of address on input of storage.

Selecting at the input to the control store, which address to use, and therefore which microinstruction is retrieved.

# G06F 9/267

# {by instruction selection on output of storage}

### **Definition statement**

This place covers:

Address formation of the next microinstruction by selection of microinstruction on output of storage.

Inputting several addresses into the control store, and selecting at the output of the control store which microinstruction to execute.

### G06F 9/268

{Microinstruction selection not based on processing results, e.g. interrupt, patch, first cycle store, diagnostic programs}

## **Definition statement**

This place covers:

Address formation of the next microinstruction by selection not based on the results of processing.

Selecting next microaddress or microinstruction not derived directly from the program flow, e.g. interrupt, patching.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Patching by microcode loading	G06F 9/24
Address formation of the next machine instruction for runtime patching	G06F 9/328

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	repairing errors of microcode in read-only storage. Usually implemented by substituting the microcode at a particular address in the microstore by a correct version during fetching.
Interrupt	changing execution flow in response to an (external) event which must be handled with a higher priority.

# Enhancement of operational speed, e.g. by using several microcontrol devices operating in parallel

#### **Definition statement**

This place covers:

Means to improve speed of microcode execution e.g. dual control stores.

Parallel or concurrent execution of microinstructions.

### Special rules of classification

Takes precedence over other sub-groups of G06F 9/22.

### G06F 9/30

Arrangements for executing machine instructions, e.g. instruction decode (for executing microinstructions G06F 9/22)

### Relationships with other classification places

- arrangements for executing specific programs G06F 9/44;
- arrangements for executing multiple programs G06F 9/46;
- arrangements for development of stored programs; Software engineering; CASE tools G06F 8/00.

#### References

### Limiting references

This place does not cover:

Arrangements for executing microinstructions	G06F 9/22
"	į l

### Special rules of classification

These rules of classification apply to the group G06F 9/30 and subgroups:

All aspects disclosed in a document which are deemed useful for search are classified.

There is no distinction made between invention and additional subject matter.

Note that combinations of subgroups are possible from different hierarchy levels, or from the same level within the hierarchy.

The following IPC subclasses are not used in this classification scheme, but are covered by the subgroups listed here:

IPC group G06F9/302 covered by CPC group G06F 9/3001;

IPC group G06F9/305 covered by CPC group G06F 9/30029;

IPC group G06F9/308 covered by CPC group G06F 9/30018;

IPC group G06F9/312 covered by CPC group G06F 9/30043;

IPC group G06F9/315 covered by CPC group G06F 9/30032;

IPC group G06F9/318 covered by CPC group G06F 9/30181.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Machine instructions	Executable instructions of the processor, which can be decoded to	
	obtain control signals	

## G06F 9/30003

# {Arrangements for executing specific machine instructions}

#### **Definition statement**

This place covers:

Execution of specific individual machine instructions with a specific opcode and/or instruction format.

Adaptation of hardware, and hardware control, to carry out the execution of a specific machine instruction with a specific opcode and/or instruction format.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Multiple parallel functional units executing instructions	G06F 9/3885
---	-------------

# Special rules of classification

In the subgroups of <u>G06F 9/30003</u>, if the execution of the machine instruction includes special arrangements for the setting of a condition code or flag, then also use <u>G06F 9/30094</u>.

In the case of a single machine instruction which carries out a combination of operations, use a subgroup for each operation.

In the subgroups hereof, the terms in capitals which are used as examples, refer to well-known types of instructions characteristic to that subgroup.

### G06F 9/30007

### {to perform operations on data operands}

### **Definition statement**

This place covers:

Specific instruction to perform operation between input data operands, usually returning an output data operand as the result.

Instructions for complex operations on data, e.g. checksum, hash, transforms, cryptography and random number generator instructions.

# Relationships with other classification places

Adders **G06F** 7/50

Multipliers G06F 7/52

Arithmetic Logic Units G06F 7/57

G06F 9/3004

# G06F 9/3001

# {Arithmetic instructions}

### **Definition statement**

This place covers:

Specific arithmetic instruction, e.g. add, multiply and multiply accumulate.

Includes how to select the specific operation to execute in an ALU.

# Relationships with other classification places

Adders **G06F** 7/50.

Multipliers G06F 7/52.

Arithmetic Logic Units G06F 7/57.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

ALU	Arithmetic Logic Unit
MAC	Multiply-Accumulate
FMA	Fused Multiply Add/Accumulate

### G06F 9/30014

# {with variable precision}

### **Definition statement**

This place covers:

Arithmetic operation where the bit width operated on may be variable precision; e.g. floating point with rounding to fit register; double precision arithmetic.

Bit-sliced arithmetic operation.

### References

#### Informative references

Multiple arithmetic units executing an instruction in tandem or cascaded	IG06F 9/3893
]	

# {Bit or string instructions}

### **Definition statement**

This place covers:

Specific instruction for operation on a series of connected bits, bytes, or characters.

Examples include the EDIT instruction which alters a portion of a character string, or a Find-First-One instruction which detects the position of the first '1' in a string of bits.

Includes cyclic redundancy check instructions.

# G06F 9/30021

# {Compare instructions, e.g. Greater-Than, Equal-To, MINMAX}

### **Definition statement**

This place covers:

Specific instruction for comparison between two operands.

Includes matching, greater/less than, minmax instruction.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

MINMAX	instruction to find the minimum of a series of input operands,	
	alternatively to find the maximum of the same.	

# G06F 9/30025

# {Format conversion instructions, e.g. Floating-Point to Integer, decimal conversion}

### **Definition statement**

This place covers:

Specific instruction for conversion from one data format to another.

Includes Endian conversion; Conversion between integer and floating-point; Decimal conversion instructions.

Data re-arranging instruction, e.g. Shuffle, Permute	G06F 9/30032

# {Logical and Boolean instructions, e.g. XOR, NOT}

### **Definition statement**

This place covers:

Specific instruction for logical operation or combination, e.g. XOR, NOT.

### G06F 9/30032

# {Movement instructions, e.g. MOVE, SHIFT, ROTATE, SHUFFLE}

### **Definition statement**

This place covers:

Specific instruction for moving, rearranging, or re-ordering data within a register.

Examples include: Move instruction which transfers data between registers; Permute/Shuffle instruction which changes the order of data in a register; Rotate or Shift instruction which moves bits or bytes within a register.

### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Instruction for operation on string operands	G06F 9/30018
Instructions for format conversion operations	G06F 9/30025
Instruction for operation on memory operands	G06F 9/3004

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Move	instructions to pass data between memory locations, or between registers, without operating on the data.
Shift	instructions to move data in a serial fashion from one location to another, where the distance moved is usually less than a word, e.g. shifting data within a register by a few bits.
Rotate	instructions which are shift instructions where the bits shifted serially out are inserted into the location at the opposite end.
Permute or Shuffle	instruction which intermingles parts of a datum to produce a new datum.

# {Instructions to perform operations on packed data, e.g. vector, tile or matrix operations}

#### **Definition statement**

This place covers:

Specific instruction operating on multiple data stored in a single register, thereby effecting a SIMD operation.

Instructions operating on packed arrays of elements, e.g. vector, tile or matrix operations.

#### References

#### Informative references

G06F 9/3885

# Special rules of classification

This subgroup may be used in combination with other subgroups of <u>G06F 9/30007</u>, according to the operation performed.

### G06F 9/30038

### {using a mask}

### **Definition statement**

This place covers:

Using a mask while operating on and/or generating packed data. A mask may contain one or more bits for each element of packed data and may be located in a mask register.

Generating a mask used for operating on and/or generating packed data.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

· mask and predicate

### G06F 9/3004

### {to perform operations on memory}

#### **Definition statement**

This place covers:

Specific instruction for operation on memory operands in general.

Specific instruction for control operation on memory.

Memory to memory Move instruction.

Stack instructions POP, PUSH

Table lookup instructions.

**Definition statement** 

A combination of a memory operation and further operation e.g. atomic memory operations such as read-modify-write, test-and-set.

Register allocation instructions.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Specific instruction for data operation	G06F 9/30007
· ·	1

### Special rules of classification

For atomic memory operations use in combination with serialisation control instructions <u>G06F 9/30087</u>, and possibly <u>G06F 9/3834</u> for memory consistency.

### G06F 9/30043

# **{LOAD or STORE instructions; Clear instruction}**

#### **Definition statement**

This place covers:

Specific instruction to read or write data from a memory location, e.g. LOAD, STORE, Load Multiple.

Specific instruction to clear or reset a memory location, e.g. CLEAR.

Register reset or clear instructions.

Context saving or restoring instructions.

### Special rules of classification

For Load Multiple when executed as an iterative instruction use also G06F 9/30065.

### G06F 9/30047

### {Prefetch instructions; cache control instructions}

### **Definition statement**

This place covers:

Specific instructions for control data or instruction prefetching from memory, e.g. Hint instruction.

Specific instructions to control cache operation, e.g. Cache Flush.

Specific instructions to control a TLB or a page table, e.g. page table entry clearing instruction.

#### G06F 9/3005

### {to perform operations for flow control}

### **Definition statement**

This place covers:

- Specific instruction to control program flow in general.
- Execution of an instruction to select a next instruction other than the next sequential instruction, e.g. for branching.

**Definition statement** 

Execution of an instruction for facilitating branching, e.g. Prepare-To-Branch instruction.

Specific instruction for monitoring or tracing program flow e.g. breakpoint instruction; flow signature instruction.

# Special rules of classification

Only to be used when there is subject matter relating to special adaptations or details of handling of an unconditional branch instruction.

### G06F 9/30054

# {Unconditional branch instructions}

### **Definition statement**

This place covers:

Special adaptations to execute a specific instruction which unconditionally branches to a target address independent of any condition.

Examples of unconditional branch instructions are CALL, GOTO and RETURN insofar as these are unconditional.

### Special rules of classification

Only to be used when there is subject matter relating to special adaptations or details of handling of an unconditional branch instruction.

### G06F 9/30058

### **{Conditional branch instructions}**

### **Definition statement**

This place covers:

Specific instruction which causes conditional branching to a target address dependent on a runtime condition, else continues execution with the next sequential instruction.

Includes IF-THEN-ELSE constructions.

### Special rules of classification

Only to be used when there is subject matter relating to special adaptations or details of handling of a specific conditional branch instruction.

# G06F 9/30061

# {Multi-way branch instructions, e.g. CASE}

### **Definition statement**

This place covers:

Specific instruction which causes a branching to one of several alternative target addresses depending on a runtime condition.

# {Loop control instructions; iterative instructions, e.g. LOOP, REPEAT}

### **Definition statement**

This place covers:

Specific instruction used for loop control, e.g. specific loop start or end instructions.

Specific instruction which is repeatedly executed, thereby forming a (short) loop, e.g. REPEAT.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Address formation for loops, loop detection	G06F 9/325
Loop buffering	G06F 9/381

### G06F 9/30069

# {Instruction skipping instructions, e.g. SKIP}

#### **Definition statement**

This place covers:

Specific instruction which causes a number of instructions to be skipped i.e. not executed, thus effecting a (short) forward branch, e.g. SKIP.

A skip of a single instruction is regarded as conditional instruction execution, not skipping.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Conditional branch instruction	G06F 9/30058
Single instruction skip as conditional execution.	G06F 9/30072

### G06F 9/30072

# {to perform conditional operations, e.g. using predicates or guards}

### **Definition statement**

This place covers:

Specific instruction for conditional operation depending on a runtime condition, which is not for control of program flow, i.e. instruction that is not a branch.

The operation carried out depends on a runtime condition, for example ADD or SUBTRACT depending on the value of the sign bit. Another example is a MOVE which is executed or not depending on a runtime condition.

Includes instructions which are executed conditional on a predicate or guard.

Includes conditional instructions in a branch shadow.

### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Conditional branch instruction	G06F 9/30058
Multiple instruction skipping for forward branch.	G06F 9/30069
Instruction which executes differently according to a mode	G06F 9/30189

# Special rules of classification

G06F 9/30058 has precedence.

May be used in combination with other sub-groups of the <u>G06F 9/30003</u> according to the operation performed by the conditional instruction, e.g. conditional MOVE in combination with <u>G06F 9/30032</u>.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Conditional	dependent on a runtime condition or operational status.
Guard	a tag indicating a condition which is assigned to an instruction. According to the outcome of the condition evaluation, the instruction is executed or skipped. Often assigned by the compiler to avoid branches
Predicate	same meaning as 'guard'

## G06F 9/30076

# {to perform miscellaneous control operations, e.g. NOP}

# **Definition statement**

This place covers:

Specific instructions for operation control in general.

Includes mode switching instructions.

Includes no-operation instructions [NOP].

### References

### Informative references

Specific instructions for program flow control	G06F 9/3005
Multi-cycle NOP used as a pipeline delay instruction	G06F 9/30079

# {Pipeline control instructions, e.g. multicycle NOP}

### **Definition statement**

This place covers:

Specific instruction to control an instruction pipeline, e.g. HALT, FLUSH

Instructions for variable delay of pipeline or execution, e.g. multicycle NOP.

# G06F 9/30083

# {Power or thermal control instructions}

### **Definition statement**

This place covers:

Specific instruction to control power consumption or thermal aspects of the processor, e.g. SLEEP.

### G06F 9/30087

# {Synchronisation or serialisation instructions}

#### **Definition statement**

This place covers:

Specific instruction to control serialisation of instruction execution; to control synchronisation of instruction execution.

Includes specific instructions used to implement memory locks; barriers. Includes instructions to facilitate atomic execution.

#### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Program synchronisation ; Mutual exclusion	<u>G06F 9/52</u>
--	------------------

### Special rules of classification

For atomic memory operations use also G06F 9/3004.

For barrier or fence instructions use also G06F 9/3834.

For synchronisation instruction which affects the execution of a thread use also G06F 9/3009.

### G06F 9/3009

# {Thread control instructions}

#### **Definition statement**

This place covers:

Specific instruction to control multi-threading; starting and stopping threads, e.g. FORK; JOIN.

# {Condition code generation, e.g. Carry, Zero flag}

### **Definition statement**

This place covers:

Special arrangements for the generation or storage of runtime conditions, e.g. flags (Carry, Zero flag, etc.); writing to status register.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Execution of instructions according to a runtime mode	G06F 9/30189
---	--------------

# G06F 9/30098

# {Register arrangements}

### **Definition statement**

This place covers:

Groups of registers; register files.

Register file addressing; addressing partial registers.

Accessing register file e.g. contention.

### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Register address space extension	G06F 9/30138
Register renaming	G06F 9/384

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Register	set of one-bit storages, e.g. latches, accessed in parallel
Register file	set of registers. May be implemented in a single or in multiple memories

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

GPR	general purpose register

# {Special purpose registers}

### **Definition statement**

This place covers:

Special adaptation of the use of single or multiple registers for a dedicated purpose, not being general purpose registers. May not be part of the register file.

Examples include particular use of dedicated address register, control register, status register, condition code register, Top Of Stack register.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

# Special rules of classification

Only to be used when there is subject matter relating to special adaptations or details of use of a special purpose register.

# G06F 9/30105

# {Register structure}

### **Definition statement**

This place covers:

Details of the structure of an individual register.

Registers having associated bits e.g. valid bits, tags, flags.

### G06F 9/30109

# {having multiple operands in a single register}

### **Definition statement**

This place covers:

Registers which are logically partitioned into multiple operands, e.g. for packed data or parallel operations.

#### References

#### Informative references

Multiple registers used for variable length operands	G06F 9/30112
--	--------------

# {comprising data of variable length}

#### **Definition statement**

This place covers:

Register structure for variable length operands, i.e. variable length data can be stored, e.g. single register for storing an M-bit integer or an N-bit integer, or a single register for storing an X-bit integer or a Y-bit floating point value.

Use of partial registers for short data.

Combinations of registers for longer or higher-precision data, e.g. by concatenation.

Accessing of variable length registers.

Attention is drawn to the following places, which may be of interest for search:

A single register for multiple operands	G06F 9/30109

### G06F 9/30116

# {Shadow registers, e.g. coupled registers, not forming part of the register space}

#### **Definition statement**

This place covers:

Registers which cannot be addressed by an instruction, and hence are invisible to the architecture, e.g. coupled registers, not forming part of the register space.

Register with an associated copy, e.g. for saving of architectural state.

### Special rules of classification

Use in combination with G06F 9/30123 for shadow register set used for another context.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Register space	the address space used by registers i.e. the range of program
•	addressable register locations.

# G06F 9/3012

### {Organisation of register space, e.g. banked or distributed register file}

### **Definition statement**

This place covers:

The physical or logical organisation of the register space in general.

**Definition statement** 

Includes partitioned, distributed or banked register files, e.g. per execution unit.

Local and global register files.

# Special rules of classification

Register banks for register space extension use G06F 9/30138.

Register banks for context data use G06F 9/30123.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Register space	logical address space for registers, i.e. the range of addresses
	defined by a register specifier

# G06F 9/30123

# {according to context, e.g. thread buffers}

#### **Definition statement**

This place covers:

Organisation of sets of registers used for storing the data of a particular context, e.g. local variables.

Includes thread buffers used to hold the context of a thread, and forming part of an instruction stream.

# Special rules of classification

Use in combination with G06F 9/30116 for shadow register set used for another context.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Context data	operands and data representing the architectural state of a
	context, and which needs to be saved on a context switch

# G06F 9/30127

### {Register windows}

### **Definition statement**

This place covers:

Organisation of sets of registers used to implement register windows.

May have a pointer to the first window location, which may be used as a base address. Used for example for fast context switching, by moving from a current window to a next window.

### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Register window	set of contiguous registers used to implement a window to hold
	context data

# {according to data content, e.g. floating-point registers, address registers}

### **Definition statement**

This place covers:

Organisation of sets of registers used to store different types of data.

Includes address registers, Boolean registers, floating point registers, parameter registers.

# G06F 9/30134

# {Register stacks; shift registers}

#### **Definition statement**

This place covers:

Register stacks are a series of register locations implementing a stack. The register stack is addressable generally using a register containing the Top-of Stack pointer. Writing to the TOS location implies adding an entry to the top of the stack, reading implies removing an entry from the top of the stack.

The implementation of stack read/write operation in a register stack may involve physically shifting the entries in the queue up or down using shift registers; or alternatively may involve incrementing or decrementing the TOS pointer to access the next or previous register.

Details of shift registers implementing a FIFO buffer are also found here.

### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Special purpose register for TOS pointer	G06F 9/30101
--	--------------

### Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

	contiguous set of register locations used to implement a stack.  May be implemented as a shift register
Shift register	register which shifts its contents in a bit-parallel fashion into an adjacent register.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

TOS	Top of Stack

# {Extension of register space, e.g. register cache}

### **Definition statement**

This place covers:

Increasing or decreasing the number of available addressable locations in register address space, e.g. more or less physical registers than logical registers, register cache.

Extension of register address length e.g. using indexing.

# G06F 9/30141

### {Implementation provisions of register files, e.g. ports}

### **Definition statement**

This place covers:

Hardware implementation of register files.

Register file port architecture; address or data ports.

Internal bypass path of register files.

Adaptations of register file hardware for particular problems, e.g. for power saving; for fault tolerance.

Includes transposing register file being accessible vertically or horizontally.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Bypass path	direct connection between a register file input and output.
-------------	---

# G06F 9/30145

# {Instruction analysis, e.g. decoding, instruction word fields}

#### **Definition statement**

This place covers:

Decoding of instructions in general, of opcode in particular.

Instruction format, instruction encoding, instruction word fields.

Instruction set as a whole.

### Relationships with other classification places

Decoding of microinstructions G06F 9/223.

# References

### Informative references

Decoding of microinstructions	G06F 9/223
-------------------------------	------------

Runtime instruction translation	G06F 9/3017
---------------------------------	-------------

# Special rules of classification

Runtime instruction translation using a decoder is classified under <u>G06F 9/3017</u> and sub-groups, even if this involves decoding, since the purpose is translation.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

RISC	Reduced Instruction Set Computer. Architecture having set of simple instructions which are decoded into direct control signals, and which take a single cycle to execute.
CISC	Complex Instruction Set Computer. Architecture having set of complex instructions which are decoded into internal (native; microcode) instructions, and which may take multiple cycles to execute.

# G06F 9/30149

# {of variable length instructions}

### **Definition statement**

This place covers:

Decoding of variable length instructions.

Includes instruction where the relative length of operation and operand part is variable.

Ensuring a whole instruction is decoded. Parsing variable length instructions (VLI).

### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Instruction pre-fetching when instruction length is variable, e.g. line-	G06F 9/3816
crossing fetch; alignment in instruction buffer	

### G06F 9/30152

# {Determining start or end of instruction; determining instruction length}

#### **Definition statement**

This place covers:

Arrangements for determining and/or marking the boundaries of a variable length instruction (VLI); Special arrangements for determining the length of a variable length instruction other than by decoding the length.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Pre-decoding of instructions

G06F 9/382

# G06F 9/30156

# {Special purpose encoding of instructions, e.g. Gray coding}

### **Definition statement**

This place covers:

Instruction encodings (e.g. Gray coding) to achieve a secondary effect, e.g. power saving, saving memory space, security, fault tolerance.

# Relationships with other classification places

Computer-aided instruction set design G06F 30/00.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Runtime instruction translation for compressed or encrypted instructions

G06F 9/30178

## Special rules of classification

Use in combination with <u>G06F 9/30178</u> for decompression by translation, or with <u>G06F 9/3822</u> for format field decoding for VLIW.

### G06F 9/3016

### {Decoding the operand specifier, e.g. specifier format}

### **Definition statement**

This place covers:

Decoding operand fields of instructions; Format of operand fields of instructions, e.g. specifier format.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Decoding the opcode of instructions

G06F 9/30145

# {with implied specifier, e.g. top of stack}

### **Definition statement**

This place covers:

Instruction format which is shorter by having operand specifier field(s) missing but implied, e.g. Top of Stack, accumulator, dedicated register.

### G06F 9/30167

# {of immediate specifier, e.g. constants}

# **Definition statement**

This place covers:

Decoding of immediate operand specifiers or constants; Concatenation of immediates; Buffering of immediates.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	data in an instruction to be used directly as an operand, e.g. without storing in a register
Constant	same meaning as 'immediate'

# G06F 9/3017

### {Runtime instruction translation, e.g. macros}

### **Definition statement**

This place covers:

Runtime translation of an instruction by decoding an instruction which is non-native to produce an instruction or set of instructions that can be decoded by the processor. The decoding of machine instructions of the executing processor's instruction set, or decoding of lower level microcode is not meant to be included here.

Altering the format or encoding of the input instruction, e.g. length of fields.

Translating a single instruction, e.g. macro, into multiple executable instructions, or the reverse (macro formation).

### References

#### Informative references

Decoding of microinstructions	G06F 9/223
Decoding of instructions	G06F 9/30145
Instruction emulation or interpretation	G06F 9/455

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Macro	An opcode which is an alias for a series of instructions, i.e. a function.
Non-native instruction	An instruction which is not executable in the architecture of the processor.

# G06F 9/30174

# {for non-native instruction set, e.g. Javabyte, legacy code}

### **Definition statement**

This place covers:

Runtime translation of a non-native instruction (e.g. Javabyte, legacy code) into an executable native instruction using hardware means, e.g. decoder, look-up table.

Runtime translation for the purpose of ISA emulation in hardware.

# Relationships with other classification places

Instruction emulation or interpretation G06F 9/455.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

set of instructions intended to execute on a different architecture, which cannot run without translation or reformatting. Legacy code may be considered non-native.
an instruction which is not executable in the architecture of the processor.

### G06F 9/30178

# {of compressed or encrypted instructions}

### **Definition statement**

This place covers:

Runtime translation of an encrypted or compressed instruction into an instruction which can be executed.

### References

### Informative references

Special encoding of instructions for saving memory or power.	G06F 9/30156

# {Instruction operation extension or modification}

### **Definition statement**

This place covers:

Modification or extension of the execution of an instruction in general.

Modifications to the instruction itself, or to the architecture, which increase the number of operations available to the architecture.

### References

Mode switching instruction	G06F 9/30076
Instruction operation extension or modification according to one or more bits in the instruction, e.g. prefix, sub-opcode	G06F 9/30185

# {according to data descriptor, e.g. dynamic data typing}

### **Definition statement**

This place covers:

Modification of the operation of an instruction according to a data type descriptor, e.g. dynamic data typing.

### G06F 9/30196

# {using decoder, e.g. decoder per instruction set, adaptable or programmable decoders}

#### **Definition statement**

This place covers:

Modification of the operation of an instruction by modifying the decoding of the instruction using more than one decoder, or a decoder which is adaptable or programmable.

Extension of the instruction set using multiple decoders for multiple instruction sets.

# G06F 9/32

# Address formation of the next instruction, e.g. by incrementing the instruction counter (G06F 9/38 takes precedence)

### **Definition statement**

This place covers:

Selecting or calculating the next instruction address.

Sequencers for machine instructions.

#### References

### Limiting references

This place does not cover:

Concurrent instruction execution, e.g. pipeline, look ahead	G06F 9/38

# {Program or instruction counter, e.g. incrementing}

#### **Definition statement**

This place covers:

Incrementing/decrementing means for the program counter.

**Definition statement** 

Selection of next PC from pre-calculated constant values, e.g. +1, +2, 0, -1.

PC arrangements, e.g. multiple PCs.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Program counter	a dedicated register which holds the address of the current
	instruction in the program sequence

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

PC	Program counter
----	-----------------

# G06F 9/322

# {for non-sequential address}

### **Definition statement**

This place covers:

Address formation, or selection, for the next instruction, being a non-sequential address.

Address calculation or selection, for the execution of branch instructions in general, e.g. for multiple types of branch.

Selection of next instruction address from various alternatives, e.g. PC, a constant, branch target, branch fall-through.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

PC address formation	address calculation, i.e. address selection
	•

### G06F 9/323

### **{for indirect branch instructions}**

#### **Definition statement**

This place covers:

Determination of program counter for an instruction that specifies where an address is located (rather than specifying the address itself) and branches using the address. The specification of the address location can be explicit (e.g. Branch R1) or implicit (e.g. RETURN). The address can be the target address or a base address used to calculate the target address.

Formation of the next instruction address for an interrupt, using hardware means e.g. look-up table.

### G06F 9/328

# {for runtime instruction patching}

### **Definition statement**

This place covers:

Formation of the address of a next instruction for the purpose of patching an instruction.

Includes detection of program addresses or instructions to be patched.

# Relationships with other classification places

Patching of software or loading of new version of software G06F 9/445.

Instruction emulation G06F 9/455.

Runtime patching of microcode in ROM G06F 9/268.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Patching	repairing errors in machine instructions in read-only storage at
	runtime. Usually implemented by substituting the instruction at a
	particular address in the memory by a correct version.

# G06F 9/34

Addressing or accessing the instruction operand or the result {; Formation of operand address; Addressing modes (address translation G06F 12/00)}

#### **Definition statement**

This place covers:

- Addressing the instruction operand or the result.
- Operand addressing modes in general.
- Endian conversion.

### Relationships with other classification places

Addressing of memories in general, address translation G06F 12/00.

--------------------------------	-------------

# G06F 9/345

### of multiple operands or results {(addressing multiple banks G06F 12/06)}

# **Definition statement**

This place covers:

Address formation for a series or group of operands, e.g. for an array.

Address formation for pairs of operands at adjacent addresses i.e. addr;addr+1.

### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Prediction of operand addresses for operand prefetching	G06F 9/3832
Addressing multiple banks	G06F 12/06

## Special rules of classification

May also be classified according to the addressing mode.

# {using stride}

### **Definition statement**

This place covers:

Address formation for a series of operands by adding a stride value to the previous address to form the next address.

May be used to predict the next operand address.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Stride	offset or displacement which may be a constant.

# G06F 9/35

# Indirect addressing

### **Definition statement**

This place covers:

Address formation using a single address operand, e.g. using the contents of an address register or GPR.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Indirect addressing	the address is the value contained in the register specified in the instruction.
Direct addressing	the address is the value specified in the instruction.
GPR	general purpose register

### G06F 9/355

# Indexed addressing

### **Definition statement**

This place covers:

Operand address formation using more than one address operand, e.g. using base + index/offset registers.

Indexed address formation or calculation details.

Uses at least two address operands which are added or concatenated. The resulting address may be longer than the base address, hence indexed addressing may be also used for address space extension.

### References

Address space extension	G06F 9/342
· ·	

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

, and the second	the address is the value contained in the base register specified in the instruction summed with the value contained in the index register specified in the instruction. The index part of the address usually consists of less bits than the base part of the address, and
	is therefore an offset from the base address

# Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

• " index"," offset", "displacement" and "delta"

## G06F 9/3552

# {using wraparound, e.g. modulo or circular addressing}

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

·	incrementing the maximum address value, e.g. 11111111 leads to wraparound to the lowest address value, e.g. 00000000, so that addressing is continuous, avoiding an overflow error
Modulo or circular addressing	same meaning than Wraparound

# G06F 9/3555

# {using scaling, e.g. multiplication of index}

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Scaling	indexed addressing where the index address is multiplied by a
	factor before adding to the base address

## G06F 9/3557

# {using program counter as base address}

## **Definition statement**

This place covers:

- · Address formation using the program counter as a base for indexed addressing;
- · PC-relative addressing.

### References

Attention is drawn to the following places, which may be of interest for search:

Next instruction addressing using an offset from the program counter.

G06F 9/324

## G06F 9/38

# Concurrent instruction execution, e.g. pipeline or look ahead

## **Definition statement**

This place covers:

Simultaneous execution of instructions in general, in parallel or pipelined.

Special architectures where instruction execution is concurrent.

Includes stack machines.

# Relationships with other classification places

Concurrent program execution: G06F 9/46.

# G06F 9/3802

# {Instruction prefetching}

#### **Definition statement**

This place covers:

Prefetching and fetching of instructions for execution, in general.

Instruction buffering; instruction caches

### G06F 9/3804

# {for branches, e.g. hedging, branch folding}

## **Definition statement**

This place covers:

Prefetching of instructions for branch paths.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Hedging	Fetching both paths of an unresolved conditional branch
Branch folding	Removal of a branch instruction from the instruction stream, e.g. by including the branch condition in an instruction as a predicate

# {using address prediction, e.g. return stack, branch history buffer}

## **Definition statement**

This place covers:

Using a history of previous branch target addresses to predict the address to fetch from, e.g. branch target buffer, branch history buffer;

Address buffers for predicting next fetch address for a branch, e.g. return address stack.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Dynamic prediction of branch direction	G06F 9/3844
Static prediction of branch direction	G06F 9/3846
Hybrid prediction of branch direction	G06F 9/3848

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

ВТВ	buffer indexed by an instruction fetch address or PC, which returns the predicted target address if the instruction is a taken branch.
ВНТ	buffer indexed by a branch instruction address, which returns a prediction of whether the branch is taken or not.
Return address stack	Stack to hold the program address to return to after a Call-type branch. The stack structure allows nesting of Calls.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

ВТВ	Branch Target Buffer
BHT	Branch History Table
BTAC	Branch Target Address Cache

## G06F 9/3808

{for instruction reuse, e.g. trace cache, branch target cache}

## **Definition statement**

This place covers:

Prefetching of instructions intended to be used more than once, thereby saving fetch time.

Buffering of instructions for reuse, e.g. trace cache.

Branch target caches for caching a branch target instruction.

The storing of addresses, e.g. branch target address caches (BTAC), is not meant to be stored here.

## Relationships with other classification places

Program tracing for monitoring G06F 11/3466.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Branch target cache	History buffer of first instruction at a branch target, which returns an instruction rather than an address, thus saving fetch time.
	Cache storing a history of previously executed paths through the program, as sequences of instructions. Accessing the trace cache returns the next predicted instructions in the sequence.

# G06F 9/381

# {Loop buffering}

#### **Definition statement**

This place covers:

Prefetching of instructions intended to be used in a loop, thereby saving fetch time;

Buffering of instructions for loops.

## References

#### Informative references

Formation of the next instruction address for a loop; detection of loops	G06F 9/325

## G06F 9/3812

# {with instruction modification, e.g. store into instruction stream}

## **Definition statement**

This place covers:

Instruction prefetching in an architecture allowing instruction modification.

How to handle store-into-instruction-stream, wherein an instruction in memory is modified, e.g. by writing back a new operand value, hence the prefetched copy of the instruction is stale.

## G06F 9/3814

# {Implementation provisions of instruction buffers, e.g. prefetch buffer; banks}

#### **Definition statement**

This place covers:

- Special arrangements for buffering of prefetched instructions;
- · Prefetch buffers;
- · Banked or partitioned instruction buffers.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Prefetch buffer	in this subclass, a buffer to hold a recently fetched set of
	instructions, usually between the instruction memory and the
	instruction decoder, e.g. cache line buffer.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used with the meaning indicated:

"cross-modifying code"	"instructions which can modify other instructions".
"self-modifying code"	"instructions which can modify themselves".

# G06F 9/3816

# {Instruction alignment, e.g. cache line crossing}

## **Definition statement**

This place covers:

Arrangements for (correct) alignment of instructions in prefetch buffers.

Instruction prefetching which crosses a line in memory or cache, for example for variable length instructions.

#### References

- "input operand" and "source"
- "output operand", "result" and "destination"

## G06F 9/3826

# {Bypassing or forwarding of data results, e.g. locally between pipeline stages or within a pipeline stage}

#### **Definition statement**

This place covers:

Arrangements for the transfer of an instruction result to a dependent instruction, without first storing in the architected state, e.g. bypassing the register file;

Transfer of operand data from the output of a functional unit to the input of another functional unit, without waiting for the completion of the data producing instruction, or without waiting for the data to be stored in the register file, e.g. locally between pipeline stages, within a pipeline stage.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Transfer of data between Store and Load instructions for memory	G06F 9/3834
consistency	

## Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

• "bypassing" and "forwarding"

## G06F 9/3828

## {with global bypass, e.g. between pipelines, between clusters}

#### **Definition statement**

This place covers:

Bypass of an instruction result to a dependent instruction in another pipeline, or group of execution units, e.g. between pipelines, between clusters;

Bypass arrangements for global data.

#### References

#### Informative references

Parallel execution units organised in clusters	G06F 9/3891

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Cluster	Group of execution units and register resources
---------	---

# G06F 9/383

# {Operand prefetching (cache prefetching G06F 12/0862)}

#### **Definition statement**

This place covers:

Prefetching of data operands;

Software data prefetching;

Prefetching from a data cache reduces cache misses during execution of the instruction using the data.

## Relationships with other classification places

Prefetching between higher level memories: G06F 12/0862.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Specific instruction to prefetch data from memory	G06F 9/30047
Instruction prefetching	G06F 9/3802
Speculative load instructions	G06F 9/3842
Prefetching between higher level memories	G06F 12/0862

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Operand prefetching	Look-ahead fetching of an operand before the execution of the
	instruction which will use the operand

# G06F 9/3832

# {Value prediction for operands; operand history buffers}

## **Definition statement**

This place covers:

Reuse or prediction of the value of an operand;

Operand value prediction using a history of the value of an operand;

Operand value buffering for reuse;

Prediction of the address of an operand.

# Relationships with other classification places

Data caches in general: G06F 12/08.

## G06F 9/3834

## {Maintaining memory consistency}

#### **Definition statement**

This place covers:

How to maintain memory consistency during operand accessing for instruction execution.

Avoiding errors caused by loads and/or stores to the same memory address being executed out of order or concurrently.

Ensuring stored operands and fetched operands are consistent, e.g. memory disambiguation.

Ensuring out-of-order loads receive the latest store information by forwarding.

# Relationships with other classification places

Cache consistency protocols: G06F 12/0815.

Multiprogramming arrangements for transaction processing: G06F 9/466.

Multiprogramming arrangements for program synchronisation: <u>G06F 9/52</u>.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Specific atomic or synchronisation instructions, e.g. Read-Modify-Write	G06F 9/30087, G06F 9/3004
Operand bypassing between Load and Store instructions	G06F 9/3826
Consistency of architectural state	G06F 9/3854
Cache consistency protocols	G06F 12/0815

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

	Keeping data in the memory up-to-date. Read data should not be stale; written data should not be overwritten by older data, which may occur in out-of-order execution.
Memory disambiguation	Checking stores against earlier executed out-of-order loads, and re-issuing the loads if their data is stale.

# {Instruction issuing, e.g. dynamic instruction scheduling or out of order instruction execution}

#### **Definition statement**

This place covers:

Runtime scheduling or issuing of instructions, e.g. dynamic instruction scheduling, out of order instruction execution.

Issuing policies or mechanisms for instructions. Instruction dispatching to execution units or execution buffers.

Concurrent execution of instructions.

Synchronisation of instruction execution.

# Relationships with other classification places

Runtime scheduling of tasks: G06F 9/4806

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Accessing of operands for issue	G06F 9/3824
Re-issuing of faulting instructions	G06F 9/3861

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Issuing	Runtime selection or scheduling of the instructions to execute.
Superscalar	Architecture where more than one instruction is selected to be executed in parallel in one cycle.
VLIW	Very Long Instruction Word being a compound instruction word formed by the compiler, containing multiple sub-instructions to be issued and completed together in one cycle

## G06F 9/3838

## {Dependency mechanisms, e.g. register scoreboarding}

## **Definition statement**

This place covers:

Special arrangements to detect or record data dependencies between instruction operands at issue time, e.g. register scoreboarding.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Data dependency	When a first instruction specifies an operand which is also specified in a following second instruction, the second instruction is dependent on the first, and cannot be executed until the dependency is resolved, or the operand is available.
Register scoreboard	Table of indicators of which instructions use which registers. May be used for dependency checking by detecting two instructions having a matching indicator.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

• "Pseudo data dependency", "false data dependency", "anti-dependency", "write-after-write dependency" and "output dependency"

## G06F 9/384

# {Register renaming}

#### **Definition statement**

This place covers:

Special arrangements to carry out register renaming, e.g. as a means of avoiding pseudo dependencies;

Rename tables and buffer, which may form part of a reorder buffer.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Reorder buffers	G06F 9/3856

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Register renaming	Associating a logical register specified in an instruction to a unique physical register. Allows multiple physical registers to be assigned to hold data for multiple instances of a logical register, thus avoiding false dependencies. Relies on the set of physical registers being larger than the set of logical registers.
RAW, read-after-write dependency	Occurs when a read to the same location occurs after a write to the same location. If the instructions are not in program order, this may lead to wrong execution.
WAW, write-after-write dependency	It occurs when a write to the same location occurs after another write to the same location. If the instructions are not in program order, this may lead to wrong execution.
Pseudo data dependency, false dependency, anti-dependency, output dependency	Dependency which may be resolved without wrong execution, e.g. a write followed in program order by another write; a read followed in program order by a write.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

- "RAW" and "read-after-write dependency"
- "WAW" and "write-after-write dependency"
- "pseudo data dependency", "false dependency", "anti-dependency", "output dependency"

# G06F 9/3842

## {Speculative instruction execution}

#### **Definition statement**

This place covers:

Execution of instructions ahead of program order, with the presumption that execution will prove to be correct, e.g. speculative loads, boosting.

Speculative instructions which are executed, e.g. alternative paths of a branch.

Execution of instructions dependent on a branch before its outcome is known.

Execution of instructions in a low-level transaction, e.g. machine instructions between a start transactional execution machine instruction and an end transactional execution machine instruction.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Conditional instruction execution, e.g. predication	G06F 9/30072
Result nullification for executed instructions	G06F 9/38585
Recovery after mis-speculation	G06F 9/3861

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Speculative instructions	Executed instructions which may not be on the actual path taken through the program, and therefore may require recovery after execution if mis-speculation occurs.
Speculative loads	Look-ahead or early execution of load instructions, where recovery would be needed in the case of mis-speculation.
Transaction	A sequence of instructions executed as an atomic group. A transaction either commits (its updates take effect), or aborts and is rolled back (its updates are discarded).

# G06F 9/3844

{using dynamic branch prediction, e.g. using branch history tables}

## **Definition statement**

This place covers:

Speculative execution of instructions using dynamic branch prediction;

**Definition statement** 

Using runtime conditions, and the previous behaviour of branches, to predict the outcome of a branch, without having to wait for its execution, e.g. branch history table;

Early generation of branch results.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Prediction of a branch address/target	G06F 9/3806
Using hybrid branch prediction	G06F 9/3848

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Dynamic prediction	Branch prediction based on runtime conditions, as opposed to compile-time branch prediction.
Branch history table	Branch prediction based on runtime conditions, as opposed to compile-time branch prediction.
Branch Target Buffer	Buffer indexed by an instruction fetch address or PC, which returns the predicted target address if the instruction is a taken branch.
Branch History Table	Buffer indexed by a branch instruction address, which returns a prediction of whether the branch is taken or not.
Branch Prediction Counter	saturating counter used to obtain a weighting for a branch prediction based on several branch executions.

## Synonyms and Keywords

In patent documents, the following abbreviations are often used:

ВТВ	Branch Target Buffer
ВНТ	Branch History Table
BTAC	Branch Target Address Cache

## G06F 9/3846

# {using static prediction, e.g. branch taken strategy}

## **Definition statement**

This place covers:

Speculative execution of instructions using static branch prediction, e.g. branch taken strategy;

Branch prediction performed by compiler, and not dependent on runtime conditions, e.g. hint bits.

## References

#### Informative references

Prediction of a branch address/target	G06F 9/3806
---------------------------------------	-------------

Informative references

Using hybrid branch prediction	G06F 9/3848

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Static prediction	Branch direction is predicted based on compile-time branch prediction.
Hint bit	Bit in branch instruction inserted by compiler to give an indication whether branch predicted taken or not.

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

• "hint bit" and "static bit"

# G06F 9/3848

# {using hybrid branch prediction, e.g. selection between prediction techniques}

#### **Definition statement**

This place covers:

Prediction schemes involving more than one type of predictor, e.g. selection between prediction techniques;

Static and dynamic prediction used alternately;

Local and global prediction mechanisms;

Two-level branch prediction.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Prediction of a branch address/target	G06F 9/3806
Using dynamic prediction, e.g. branch history table	G06F 9/3844
Using static prediction, e.g. branch taken strategy	G06F 9/3846

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Two-level branch prediction	Two-dimensional prediction where the output of one method is	
	used as an index into another method to provide a prediction (e.g.	
	branch history's output as an index into a pattern history table).	

# {from multiple instruction streams, e.g. multistreaming}

#### **Definition statement**

This place covers:

- Issuing instructions from multiple threads each having a context, including at least a program counter, and possibly registers and execution resources;
- Includes multiple streams for different threads, or from both directions of a branch;
- Interleaved execution of threads in a single or in multiple streams;
- · Stream selection.

# Relationships with other classification places

Thread scheduling or multithreading at OS or application level G06F 9/46.

Context registers for multiple streams	G06F 9/30123
Execution units or pipeline architectures for executing multiple streams	G06F 9/3889

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Instruction stream	Architectural aspects, e.g. resources and context, used to execute
	a thread or series of instructions. Includes at least a program
	counter, and possibly including dedicated instruction buffers,
	registers, status register, execution units.

# G06F 9/3853

# {of compound instructions}

#### **Definition statement**

This place covers:

Issuing of compound instructions;

Compounding single instructions into a group;

Issuing a group of instructions, that must complete in the same cycle;

Dispatching aspects of compound instructions, e.g. variable format VLIW instructions.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Decoding of VLIW format field	G06F 9/3822

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Compound instruction	Consisting of sub-instructions, i.e. contains multiple opcodes, e.g	
	VLIW instructions.	

## G06F 9/3854

# {Instruction completion, e.g. retiring, committing or graduating}

## **Definition statement**

This place covers:

Post-execution stages

## G06F 9/3856

# {Reordering of instructions, e.g. using queues or age tags}

#### **Definition statement**

This place covers:

Special arrangements for reordering of instructions issued out-of-order;

Queue arrangements include reorder buffers;

Age tags include marking the instructions with the original program order.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Reordering	Restoring the program order after instruction execution, ensuring that the instructions complete in the correct order.
	An indicator associated with an instruction to indicate its original program order, e.g. in the case of instructions executed out-of-order.

## G06F 9/3858

# {Result writeback, i.e. updating the architectural state or memory}

#### **Definition statement**

This place covers:

Special arrangements to write back results to the architectural state or memory, which may be for ensuring correctness of the architectural state;

**Definition statement** 

Special arrangements to write back multiple results from a low-level atomic or transactional block, e.g. machine instructions between a start transactional execution machine instruction and an end transactional execution machine instruction.

Specific machine instruction to store data to memory	G06F 9/30043
Maintaining memory consistency	G06F 9/3834
Recovery of architectural state after an exception	G06F 9/3861

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Runtime data in the pipeline resources, including program counter, instruction queue, status register, condition codes, general purpose and special purpose registers, rename data, pipeline registers, etc. The state is updated when one of these resources is
written to.

## G06F 9/38585

# {with result invalidation, e.g. nullification}

## **Definition statement**

This place covers:

Ensuring correctness of the architectural state by nullifying the results of wrongly executed instructions.

Nullifying may use, for example, preventing writeback; tagging the result as invalid; clearing of result.

Arrangements for nullifying the result of a predicted instruction where the predicate resolves to false.

Nullifying multiple results from a low-level atomic or transactional block, e.g. machine instructions between a start transactional execution machine instruction and an end transactional execution machine instruction.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Instructions which execute conditionally	G06F 9/30072
Recovery from exceptions	G06F 9/3861

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Nullification	Invalidation of an instruction result. The instruction has already
	executed, but the results are invalid, and must not update the
	architectural state.

# {Recovery, e.g. branch miss-prediction, exception handling (error detection or correction G06F 11/00)}

#### **Definition statement**

This place covers:

Recovery of correct instruction execution after an exception or fault;

Restoring the correct architectural state after an exception, e.g. after branch mis-prediction, arithmetic overflow.

May require nullifying wrong results; flushing the instructions in the pipeline; restarting the pipeline from the point of exception.

# Relationships with other classification places

Error detection or correction: G06F 11/00.

Exception handling in genera: G06F 11/0793.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Instruction result nullification	G06F 9/38585
----------------------------------	--------------

## Special rules of classification

The group is only to be used for the handling of exceptions caused by instruction execution.

#### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Architectural state	The runtime data in the pipeline resources, including program counter, instruction queue, status register, condition codes, general purpose and special purpose registers, rename data, pipeline registers etc.
Exception, fault	Error caused by the execution of an instruction, e.g. floating point overflow; page fault; mis-speculation.

## G06F 9/3863

#### {using multiple copies of the architectural state, e.g. shadow registers}

#### **Definition statement**

This place covers:

Recovery using multiple copies of architectural state;

Restoring the architectural state to that previous to an exception using a previous version of the state, e.g. checkpoint, future file, shadow registers. Also known as rollback.

## Relationships with other classification places

Software debugging: G06F 11/36.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Shadow register structure	G06F 9/30116

## Special rules of classification

The subgroup is only to be used for the handling of exceptions caused by instruction execution. In particular, checkpointing for software debugging is not meant.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

the runtime data in the pipeline resources, including program
counter, instruction queue, status register, condition codes, general purpose and special purpose registers, rename data, pipeline registers etc.

# G06F 9/3865

# {using deferred exception handling, e.g. exception flags}

## **Definition statement**

This place covers:

Handling or nullification of an instruction exception, e.g. using exception flags, which does not occur in the cycle in which the exception is detected, but later, e.g. at writeback stage.

## G06F 9/3867

## **{using instruction pipelines}**

#### **Definition statement**

This place covers:

Concurrent execution using instruction pipelines;

Control of instructions moving through a pipeline of functional stages. A typical pipeline consists of these stages: Instruction fetch; Instruction decode; Operand fetching; Instruction issue; Instruction execution; Instruction completion/Result writeback;

Pipeline control, e.g. flushing, halting;

Pipeline stages, e.g. type of stage, number of stages;

Variable length pipeline, e.g. elastic pipeline;

Counterflow pipeline;

Cascaded pipelines.

# Relationships with other classification places

Data-driven systems, e.g. tokens: <u>G06F 9/4494</u>.

Computer architectures for data-driven systems: G06F 15/82.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Specific instructions for pipeline control	G06F 9/30079
Asynchronous pipeline control, e.g. using handshaking	G06F 9/3871

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Pipeline	Series of linearly sequential execution stages for executing instructions. The stages have buffers between them for output data which is input into the next stage. The buffers may be clocked so that data from one stage moves into the next stage on a clock signal. All stages move at once, else an asynchronous pipeline.
Counterflow pipeline	Pipeline in which instructions travel down pipeline, but data travels up pipeline.
Cascaded pipeline	Parallel pipelines where a group of instructions are issued in successive cycles to produce a staggered execution of the group.

## G06F 9/3869

# {Implementation aspects, e.g. pipeline latches; pipeline synchronisation and clocking}

# **Definition statement**

This place covers:

Instruction pipeline synchronisation;

Timing aspects of instruction pipelines, e.g. clock cycle, derating;

Clocking of pipeline stages; clock domains;

Clock skew problems;

Clock gating in pipelines, e.g. for power saving;

Latches and buffers between pipelines stages.

## References

Chasifia instructions for pinaling control	G06F 9/30079
Specific instructions for pipeline control.	GUBF 9/30079

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Clock skew	lack of synchronicity between instances of a clock signal caused,	
	e.g. by differing clock wire lengths.	

## G06F 9/3871

# {Asynchronous instruction pipeline, e.g. using handshake signals between stages}

## **Definition statement**

This place covers:

Asynchronous pipeline, e.g. using handshake signals between stages, e.g. ACK, DONE signals.

Pipelines where the stages do not all move at the same time.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Asynchronous pipeline	Pipeline where not all stages move at once, e.g. execution in a stage starts when a signal is received from previous stage, and ends by sending a done signal to next stage.
Handshake signals	Exchange of signals between stages, e.g. to inform a next stage when data is available to process, and to inform a previous stage when data may be forwarded.

# G06F 9/3873

# {Variable length pipelines, e.g. elastic pipeline}

## **Definition statement**

This place covers:

Pipeline with dynamically varying length, e.g. elastic pipeline.

Multiple pipelines having different lengths.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Pipeline length	The number of pipeline stages.
·	· · · · · · · · · · · · · · · · · · ·

# {Pipelining a single stage, e.g. superpipelining}

#### **Definition statement**

This place covers:

Pipeline architecture where a single stage is split into sub-stages (e.g. superpipelining) using pipeline buffer, with higher clocking rate implied for that stage, e.g. pipelined execution unit; pipelined decode unit.

Pipeline architecture having multiple stages for the same function, e.g. two execution stages, without higher clock rate.

#### References

Pipelined decoding	G06F 9/382
--------------------	------------

## G06F 9/3877

{using a slave processor, e.g. coprocessor (peripheral processor G06F 13/12; vector processor G06F 15/8053)}

## **Definition statement**

This place covers:

Concurrent instruction execution using slave processor or coprocessor which controls its own execution i.e. has a decode unit or sequencer;

Means and protocol to transfer instructions and data to a slave processor, and to receive results in return;

Detection of presence or absence of a slave processor;

Reconfigurable coprocessors i.e. not special purpose.

#### Relationships with other classification places

Vector processors: G06F, G06F 15/8053.

Cryptographic processors: G06F 21/123.

I/O or DMA processors: G06F 13/12.

Image or graphics processors: G06T 1/20.

Digital data processing G06F 17/00, G06F

In this place, the following terms or expressions are used with the meaning indicated:

Host master processor to which the coprocessor is a slave
---

## **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

• "COP" and "coprocessor"

## G06F 9/3879

# {for non-native instruction execution, e.g. executing a command; for Java instruction set}

#### **Definition statement**

This place covers:

Slave processors which receive and decode instructions which are not explicit in the instruction set of the host, e.g. commands; function calls; using an escape code; using memory-mapped commands;

Slave processors which are adapted to execute a non-native instruction set, e.g. Java coprocessor.

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Non-native instruction set	Instructions which cannot be executed on the master processor

# G06F 9/3881

## {Arrangements for communication of instructions and data}

#### **Definition statement**

This place covers:

Special arrangements or protocols for transfer of instructions or commands, and for exchange of data with a slave processor which executes non-native instructions.

## G06F 9/3885

# {using a plurality of independent parallel functional units}

#### **Definition statement**

This place covers:

Special arrangements for concurrent instruction execution using parallel functional units, implying the concurrent execution of multiple instructions, one in each of the functional units;

Parallel execution pipelines.

## Relationships with other classification places

Arrays of processors <u>G06F 15/78</u>, <u>G06F 15/80</u>, <u>G06F 15/16</u>.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Parallel decode units	G06F 9/3822
Concurrent execution using a slave processor	G06F 9/3877

# Special rules of classification

This group is only to be used for special architectural arrangements to enable the concurrent execution of instructions, not for the mere presence of parallel functional units.

Parallel functional units does not usually mean parallel processors. Multicore architectures may be found here only if they carry out concurrent execution of instructions from the same program.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Functional unit	Unit within the processor which carries out part of the execution of
	an instruction.

## G06F 9/3887

# {controlled by a single instruction for multiple data lanes [SIMD]}

#### **Definition statement**

This place covers:

Multiple parallel functional units controlled by a single instruction, e.g. SIMD.

For SIMD execution, this class contains details relevant to the execution aspects, e.g. executing a global instruction according to local conditions.

## Relationships with other classification places

SIMD architectures: G06F 15/80.

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

SIMD	Acronym for "single instruction multiple data" being an architecture
	having a set of homogenous execution units which execute the
	same instruction in any given cycle, but which each have their own
	operand data, e.g. vector data.

## G06F 9/38873

## {Iterative single instructions for multiple data lanes [SIMD]}

#### **Definition statement**

This place covers:

Special arrangements at runtime for performing multiple iterations of a loop in parallel using SIMD lanes.

Parallelism detection by a compiler	G06F 8/456

# G06F 9/38875

# {for adaptable or variable architectural vector length}

#### **Definition statement**

This place covers:

Runtime determination of a vector length used for performing multiple iterations of a loop in parallel.

Using a vector length variable stored in a vector length register for performing multiple iterations of a loop in parallel.

## G06F 9/3888

# {controlled by a single instruction for multiple threads [SIMT] in parallel}

#### **Definition statement**

This place covers:

An execution model where multiple independent threads execute a same instruction in parallel, typically on different data elements (SIMT), where conditional instructions may cause different threads to follow divergent execution paths through a program, which may result in individual threads being inactive at times, and each thread may have its own instruction address counter and register state.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Warp	A warp is a set of parallel threads that execute the same instruction together.
Thread Block	A thread block is a set of concurrent threads that can cooperate among themselves through barrier synchronization and shared access to a memory space private to the thread block. Once a thread block is assigned to a streaming multiprocessor, it is further partitioned into warps.
Grid	A grid is a set of thread blocks that may each be executed independently and thus may execute in parallel.
Streaming multiprocessor	A streaming multiprocessor executes warps and comprises multiple stream processors.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

SIMT	Single Instruction Multiple Thread
СТА	Cooperative Thread Array
GPGPU	General-Purpose Computing on Graphics Processing Units
SM	Streaming Multiprocessor
SP	Streaming Processor
CUDA	Compute Unified Device Architecture
OpenCL	Open Computing Language

In patent documents, the following words/expressions are often used as synonyms:

- "CUDA", "OpenCL" and "GPGPU"
- "thread block", "work group" and "cooperative thread array"
- "thread" and "work item"
- "warp", "wavefront" and "thread group"
- "streaming multi-processor" and "compute unit"

# G06F 9/38885

# **{Divergence aspects}**

## **Definition statement**

This place covers:

Special arrangements, in a SIMT architecture, to handle different threads following divergent execution paths (e.g., control flow paths) through a program due to a conditional instruction.

Reconvergence of threads in a SIMT architecture.

# {controlled by multiple instructions, e.g. MIMD, decoupled access or execute}

#### **Definition statement**

This place covers:

Multiple parallel functional units controlled collectively by multiple instructions.

Includes special techniques of parallel functional unit control in a superscalar or VLIW architecture.

Hardware streams.

## Relationships with other classification places

MIMD architectures: G06F 15/16.

## Special rules of classification

This group is only to be used for special architectural arrangements to enable the concurrent execution of instructions, not for the mere presence of parallel functional units executing multiple instructions.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

MIMD	Acronym for "multiple instruction multiple data" being an architecture having a set of homogenous execution units which execute different instructions in any given cycle, and which each have their own operand data.
VLIW	Acronym for "very long instruction word" being an architecture having a compound instruction word formed by the compiler, containing multiple sub-instructions to be issued and completed together in one cycle, and having no interdependencies.
Hardware stream	Hardware resources used for the context and execution of a stream or thread of instructions.

## G06F 9/3891

# {organised in groups of units sharing resources, e.g. clusters}

## **Definition statement**

This place covers:

Control of parallel execution by groups of functional units, such as multiple execution units sharing local memory, e.g. clusters;

Partitioned architectures, e.g. for hardware multistreaming.

#### **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Cluster	Group of execution units with shared register resources.
	Hardware resources used for the context and execution of a stream or thread of instructions.

# {controlled in tandem, e.g. multiplier-accumulator}

#### **Definition statement**

This place covers:

Multiple functional units which are controlled in tandem or cascade to carry out an instruction.

Multiple functional units controlled by the same instruction but not in the same cycle, e.g. multiplier-accumulator.

## Relationships with other classification places

Hierarchical adders: G06F 7/50.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

MAC	Multiplier-accumulator unit
FMA	Fused multiplier-accumulator unit

## G06F 9/3895

# {for complex operations, e.g. multidimensional or interleaved address generators, macros}

#### **Definition statement**

This place covers:

Multiple functional units which are controlled in tandem or cascade to carry out an instruction which is a complex operation, possibly over multiple cycles.

# G06F 9/3897

## {with adaptable data path}

#### **Definition statement**

This place covers:

Parallel functional units controlled in tandem to execute complex operations using adaptable datapath.

## Relationships with other classification places

Reconfigurable computer architectures: G06F 15/7867.

# G06F 9/44

## Arrangements for executing specific programs

#### **Definition statement**

This place covers:

Execution of a single program.

Program initiating or program switching in the context of	G06F 9/48
multiprogramming	

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

High level language	refers to what is commonly known in the art, i.e. a language containing human readable constructs intended to be used by a human programmer and to be translated to binary code for execution. The fact that it is theoretically possible to read, understand and directly program binary code does not qualify this type of code as HLL.
Low-level language	language that provides little or no abstraction from a computer's instruction set architecture

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

HLL	High level language

# G06F 9/4401

## Bootstrapping (security arrangements therefor <u>G06F 21/57</u>)

# **Definition statement**

This place covers:

Starting up or shutting down a computer system and loading of the operating system.

#### References

#### Limiting references

This place does not cover:

Security arrangements for bootstrapping	G06F 21/57

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Bootstrap	a simple program that begins initialisation of the computer's
	operating system

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

IPL	Initial program load

# G06F 9/4403

# {Processor initialisation}

## **Definition statement**

This place covers:

Initialisation of the processor and the processor's direct environment immediately after the initial reset signal.

This group deals with local issues - there is no network involved.

## Includes:

- · Initial microcode loading;
- Selecting the very first instructions to be executed after a hardware reset;
- · Processor address boot facilities;
- I/O channel initialisation;
- Making BIOS ROM invisible after booting;
- Means to shadow BIOS from ROM to (faster) RAM.

# G06F 9/4411

# {Configuring for operating with peripheral devices; Loading of device drivers}

#### **Definition statement**

This place covers:

Initialisation and configuration of peripheral devices, insofar as this configuration is related to the interaction with the operating system.

Also deals with the configuration of the operating system in order to be able to interact with peripheral devices.

A peripheral device in this class should be understood as a passive entity, i.e. whose functioning is controlled by the host computer to which it is attached. Systems involving a host computer with attached devices that have processing capabilities of their own should be treated as a multiprocessor or a networked distributed system.

This initialisation/configuration does not have to occur during booting (although it typically does) - it can also take place e.g. when a device is hot-inserted (plug and play).

This group deals with local issues - there is no network involved.

- · Assigning IRQ lines, I/O addresses;
- Configuring registers on the peripheral;
- Device discovery: detecting which devices are present; building device trees;
- · Adapting OS for device configuration;
- · Device initialisation;
- · Config.sys peripheral device facilities.

Loading or installation of device drivers. This does not necessarily have to occur at boot time.

# Special rules of classification

A device driver is understood to be software used by a computer to control/operate a peripheral device. A peripheral is any kind of device that can be attached to/inserted into a computer in order to expand its functionality (modem, sound card, disk drives). A device driver- i.e. the piece of software that is loaded on a host computer and that enables the host computer to control the operation of an attached peripheral - differs from the peripheral's operating software - i.e. the piece of software that resides on the peripheral itself and executed by the peripheral's processor that allows the peripheral to operate as an independent unit.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Peripheral Internal	an expansion card that is plugged into one of the ISA/PCI slots
Peripheral External	an external device connected through the serial/parallel port a PC card

# G06F 9/4413

# {Plug-and-play [PnP]}

## **Definition statement**

This place covers:

Arrangements for automating the process of device driver loading or configuration of a peripheral device or the operating environment of the computing element hosting the peripheral device in in response to dynamic changes in the peripheral constitution of the computing element (addition or removal of peripheral devices).

Plug-and-play in the context of this class occurs either during boot time or during run-time (live addition or removal).

## {Self describing peripheral devices}

#### **Definition statement**

This place covers:

The peripheral device itself contains all the information (or a reference to a place where the information is stored) required for its configuration and the configuration of the operating environment. In other words, it is the peripheral device and not the operating environment that is burdened with the task of providing configuration information or device drivers.

## G06F 9/4416

## {Network booting; Remote initial program loading [RIPL]}

#### **Definition statement**

This place covers:

Booting of client computers, processors or devices that do not have the necessary boot code locally available but retrieve the boot code from a remote source, e.g. a boot server in a network environment.

Specific topics included:

- Booting of diskless computers ("net" computers);
- "Push" booting: a server computer boots a client computer by sending a boot program to the client computer;
- PXE (Preboot Execution Environment)

The Preboot Execution Environment (PXE) is an industry standard client/server interface that allows networked computers that are not yet loaded with an operating system to be configured and booted remotely by an administrator. The PXE process consists of the client notifying the server that it uses PXE. If the server uses PXE, it sends the client a list of boot servers that contain the operating systems available. The client finds the boot server it needs and receives the name of the file to download. The client then downloads the file using Trivial File Transfer Protocol and executes it, which loads the operating system.

- Booting a thin client in a "client device/data center" environment (see US2006/161765);
- Network booting;
- · Booting diskless workstations;
- · Booting thin clients.

## Special rules of classification

Remote booting in the context of a first-time and one-off installation of an OS is also classifed in the G06F 8/61.

## **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

RIPL	Remote Initial Program Load
PXE	Preboot Execution Environment

## G06F 9/4418

## {Suspend and resume; Hibernate and awake}

## **Definition statement**

This place covers:

Suspend/Resume and Hibernate/Wake Up refer to techniques to put a system in a low power, non-operating mode, thereby preserving the system state that existed at the time of going into Suspend or Hibernate. The next time the computer is started, operation continues at the point where it left off, rather than starting from scratch.

- Speeding up the boot process by restoring persisted data from previous executions rather than going to the whole boot process.
- Hibernating a system to persistent storage on a first computer, transporting the storage to a second computer and resuming the execution there. Please note that this is not process migration.
- Multiple removable storage devices, each having a different hibernated system image stored thereon; resuming the different system images on one computer by switching the storage devices.
- Quickly bringing a computer into an operational state by copying a memory image from persistent storage to RAM, thereby bypassing the lengthy conventional boot process.

Power Management	G06F 1/3203
Normal Shutdown (without saving state information - the next boot starts from scratch)	G06F 9/4401
Suspending a running process and resuming its execution later in the context of process scheduling	G06F 9/461, G06F 9/4881
Booting a computer system when an error/ fault is involved. Includes Dealing with errors that occur during the boot process itself (e.g. when encountering a corrupt BIOS); * Rebooting the system after a previous irregular shutdown (e.g. due to a power failure), thereby restoring as much as possible the system state that existed before the irregular shutdown occurred. In absence of an emergency power supply, a power failure will cause the computer system to be simply powered down, inevitably resulting in the loss of system state. The next time the computer is booted, the system state will be restored as much as possible.	G06F 11/1417

Graceful shutdown: When a power failure is detected, an emergency power supply (e.g. UPS) is activated giving the system enough time to do a proper shutdown (when shutting down a computer system, no state information is saved). Graceful hibernation:When a power failure is detected, an emergency power supply (e.g. UPS) is activated giving the system enough time to do a proper hibernation (thereby saving the system state) before eventually powering down. Dealing with power failures that occur when the system is in suspend mode, i.e. when the RAM is still powered; In battery-powered systems, suspending or hibernating the system when the battery level drops below a predetermined level	<u>G06F 11/1441</u>
Wake-on-LAN	H04L 12/12

# Special rules of classification

The techniques of Suspension and Hibernation differ from each other in the degree of persistency of saving the system state.

With Hibernation, the system state is stored on a non-volatile memory device, e.g. HDD, while in the case of Suspension, the system state is stored in volatile memory (e.g. RAM).

In the <u>G06F 9/4418</u> we only deal with situations where the reason or the system to suspend or hibernate is controlled/intentional e.g. after user presses power off button, after a preset period of inactivity for power saving purposes. When the reason to suspend or hibernate is the occurrence of a power failure, low battery voltage or another anomaly (e.g. system hang), then the document should be classified in <u>G06F 11/1441</u> (see Related Fields). The subsequent restart of the system is classified in <u>G06F 11/14417</u>.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Hibernation	also known as Suspend-to-Disk (S2D) and is defined as sleeping mode S4 in the ACPI specification.
Suspension	also known as Suspend-to-RAM (STR) and is defined as sleeping mode S3 in the ACPI specification.

## G06F 9/442

## {Shutdown}

#### **Definition statement**

# G06F 9/44521

# {Dynamic linking or loading; Link editing at or after load time, e.g. Java class loading}

## **Definition statement**

This place covers:

Ways to load program code whereby, rather than first loading the entire program code before starting execution, the program code is loaded only when needed.

## Also includes:

- Saving memory space and preventing unnecessary processing by only loading the program parts that are actually used; Parts that are never executed are never loaded;
- Starting execution once certain parts are loaded: no need to wait for the whole program to be loaded:
- · Executing instructions as they are loaded: the idea of streaming;
- · Java constant pool resolution
- Dynamic linking/loading is also known as: incremental, partial, run-time, lazy; on-demand linking/ loading.

## **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

DLLs	Dynamic Link Library

# G06F 9/44526

# {Plug-ins; Add-ons}

## **Definition statement**

This place covers:

Dynamically loading special software components to exisitng applications in order to extend their functionality, e.g. Adobe Flash-Player.

## G06F 9/44536

# {Selecting among different versions}

## **Definition statement**

This place covers:

Determining the right version of a software component to be loaded.

# G06F 9/44542

# {Retargetable}

## **Definition statement**

This place covers:

Program loading explicitly taking into account hardware characteristics of the target.

Computer programs containing code native to multiple instruction sets (processor architectures).

# G06F 9/44552

# {Conflict resolution, i.e. enabling coexistence of conflicting executables}

## **Definition statement**

This place covers:

Mechanisms to allow e.g. different versions of conflicting libraries to be used simultaneously; for example the Windows "DLL Hell".

## G06F 9/44557

# {Code layout in executable memory}

#### **Definition statement**

This place covers:

How software components should be placed in a RAM, e.g. occupying neigbouring sections.

## G06F 9/44563

## {Sharing}

#### **Definition statement**

This place covers:

- Sharing program code/data between different applications in order to reduce the memory footprint;
- Solutions to problems that arise when program code/data is shared (e.g. sharing of global variables and Java static fields), often resulting in the duplication of program code/data.

## G06F 9/44568

# {Immediately runnable code}

#### **Definition statement**

This place covers:

Running programs without having to install or load them beforehand. Execute-in-place refers to running without loading (i.e. without copying to RAM), while portable applications more refer to running without installing.

## G06F 9/44573

# {Execute-in-place [XIP]}

## **Definition statement**

This place covers:

Skipping or reducing the step of loading and initialization of program code.

Techniques used:

- XIP: eXecute-In-Place: execute programs from where they are persistenly stored. There is no program loading.
- Pre-initialise modules: program code may be loaded, but it is already partially or totally initialised
- · Romization of program code

XIP (Execute In Place) refers to the execution program code directly from the memory where it is stored, without first loading the program code to volatile executable memory (RAM).

Where the <u>G06F 9/445</u> relates to the preparatory process of making program code ready for execution - loading, i.e. transferring the code to executable memory; linking, i.e. resolving references; initializing data structures - XIP relates to methods where the program code can be directly executed without having to go through this preparatory process.

One definition of XIP, taken from US2002/069342: "A XIP architecture is defined by a system's ability to execute one or more bytes of code while still resident within non-volatile memory (e.g., read-only

**Definition statement** 

memory (ROM)), without first transferring the code to volatile memory (e.g., random access memory (RAM)."

Another definition of XIP, taken from US2004/193864: "A called execute-in-place (XIP) technology refers to a specific function provided with a storage device, which data or command codes stored in the storage device can be directly accessed by a central processing unit (CPU) in a computer system, without pass through a random access memory (RAM), thus reducing power consumption and data loss, and increasing executing speed."

For program code to be directly executable from the memory where it is stored, it is required that the memory is suitable to directly execute code (read US2002/138702, [0004]-[0008]), and that the code is in such a form that it can be directly executed.

#### Examples of XIP:

- In normal computer systems, directly executing program code from an externally connected memory device;
- In embedded systems, executing the software directly from the non-volatile memory where it is stored.

#### Also included:

- Romization, romizer: processes and tools to generate a directly-executable program image.
- Semi-directly-executable code: the code is partially prepared for execution, the rest takes place at load time.

# Special rules of classification

The U3 technology does not fall under the XIP technology, because the program code is not executed directly from the USB stick.

## G06F 9/44578

## {Preparing or optimising for loading}

# **Definition statement**

This place covers:

Specific techniques to make code immediately runnable, e.g. making address adjustments (relocation) to enable immediate execution, or prebinding (Mac OS). General aspects of pre-runtime link editing are however classified in G06F 8/54.

## G06F 9/44584

# {Portable applications, i.e. making applications self-contained, e.g. U3 standard}

#### **Definition statement**

This place covers:

Executing applications without installing them before, for example according to the U3 standard, or portable application packages ("Portable App") started directly from a USB stick.

## G06F 9/44589

{Program code verification, e.g. Java bytecode verification, proof-carrying code (high-level semantic checks <u>G06F 8/43</u>; testing and debugging software <u>G06F 11/36</u>)}

## **Definition statement**

This place covers:

Verification of program code, for example:

Java bytecode verification.

Proof carrying code.

inter instruction consistency checks.

#### References

## Limiting references

This place does not cover:

High-level semantic checks	G06F 8/43
Testing and debugging software	G06F 11/36

# Special rules of classification

- In G06F 11/36 group, the question is: does the program do what it is expected to do? In other words, for a given input, does the program produce the expected output? The program is considered as a black box, only the external behaviour is studied. The tests that are performed do not take into account the implementation or the language that is used to write the program. We are here on the level of users/developers/specifications.
- In <u>G06F 9/44589</u>, a test is performed to see whether the (compiled) program code does not do anything that is not allowed by the rules of the target machine. In other words, the question is: does the program comply with code specific requirements?

The two groups are on a different level. It is possible for a program to respect all code specific requirements and thus to pass <u>G06F 9/44589</u> tests, but not to produce the expected output and thus not to pass the <u>G06F 11/36</u> test

In the G06F 8/43 (Compile-time checking), source code is checked. In most cases, this is done by
the compiler but it can also be performed by a separate program. In contrast, the G06F 9/44589
tests already compiled code. In the G06F 8/43, the verification is performed based on source code
specific aspects, whereas in the G06F 9/44589 this is done on the basis of target machine related
aspects

## G06F 9/44594

## {Unloading}

## **Definition statement**

This place covers:

- Unloading program components from memory or terminating applications, e.g. when they are not needed anymore.
- Java class unloading: removing Java classes from memory when they are not used anymore, e.g. because the class has become "unreachable".

**Definition statement** 

Class unloading is not the same as Garbage Collection: in class unloading, what is removed is program code in executable memory (classes), whereas in Garbage Collection it is data (objects, i.e. class instances) that are removed.

## References

## Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Uninstallation	G06F 8/62
Garbage collection	G06F 12/0253

# G06F 9/448

## Execution paradigms, e.g. implementations of programming paradigms

#### **Definition statement**

This place covers:

Implementations of specific programming paradigms to execute computer programs, the programming paradigms being e.g. object-orientated, procedural, data driven or finite state machine

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Object offerted	00	Object-oriented
-----------------	----	-----------------

## G06F 9/4482

## {Procedural}

## **Definition statement**

This place covers:

Relates to procedural execution, i.e. imperative programming where the program is built from one or more procedures (subroutines).

## G06F 9/4484

## {Executing subprograms}

#### Definition statement

This place covers:

Invocation and execution of subroutines, for example:

- Implementation of a call stack: creating and deleting activation records, reserving space on the stack to store local variables and to pass the arguments
- Argument passing
- Locating variables at higher level in the invocation chain
- Co-routines
- · Re-entrant functions

**Definition statement** 

 Function or method overloading: considering the type of all actual arguments/return type of a function to select a proper function instance to execute Calling functions in another programming language

Also covered are other combinations of several instructions, for example combinations of instructions to perform (counted) loops.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Hardware implementation of instructions that change the program flow to another address (jumps, branches, goto)	G06F 9/30
Remote procedure calls (RPC)	G06F 9/547
Stack caching	G06F 12/0875

# **Synonyms and Keywords**

In patent documents, the following words/expressions are often used as synonyms:

· Subprograms, subroutines, functions, procedures, object oriented methods

# G06F 9/4486

# {Formation of subprogram jump address}

## **Definition statement**

This place covers:

Finding the entry address of a subroutine and how to preserve the return address

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Static linking, i.e. before load-time	G06F 8/54
Hardware implementation of instructions specifically designed to keep the return address (e.g. branch-and-link, jsr)	G06F 9/30
Branch prediction in a pipelined system	G06F 9/3844, G06F 9/3846
Dynamic linking, i.e. at or after load-time	G06F 9/44521

## G06F 9/4488

# {Object-oriented}

#### **Definition statement**

This place covers:

Execution aspects of object-oriented programs

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

00	Object-oriented

# G06F 9/449

## **{Object-oriented method invocation or resolution}**

## **Definition statement**

This place covers:

- Object-oriented method resolution, i.e. given a method invocation on a reference (pointer) to an object, how to locate the correct code that implements this method. Typically this is done using virtual function tables.
- Only deals with the resolution of an object-oriented method.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Remote method invocation (RMI)	G06F 9/548
--------------------------------	------------

# G06F 9/4491

# {Optimising based on receiver type}

## **Definition statement**

This place covers:

 Speeding up the run-time object-oriented method resolution by predicting the type of the referenced object

# Synonyms and Keywords

In patent documents, the following abbreviations are often used:

	i
PIC	Polymorphic inline cache
	, , ,

# G06F 9/4492

# {Inheritance}

## **Definition statement**

This place covers:

Object oriented class hierarchies including run-time addition of classes to a hierarchy virtual inheritance and/or polymorphism.

#### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Object-oriented method resolution	G06F 9/449

# Special rules of classification

Documents in <u>G06F 9/449</u> deal with Object-oriented method invocation and will inevitably talk about class hierarchies, which is the subject of <u>G06F 9/4492</u>. However, this alone does not justify classification in <u>G06F 9/4492</u>: only when the document discloses specific details about class hierarchies, the symbol <u>G06F 9/4492</u> is justified.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Method overriding	subclass provides a specific implementation of a method that is already provided by one of its superclasses
Polymorphism	creating a variable, a method or an object that has more than one form

# G06F 9/4493

## {Object persistence}

## **Definition statement**

This place covers:

• Making objects persistent and restoring objects from persisted form.

## Includes:

- · Pointer swizzling
- · Flattening objects

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Serialization in the context of RPC, RMI	G06F 9/547, G06F 9/548
OO databases	G06F 16/30

## G06F 9/4494

# {data driven}

#### **Definition statement**

This place covers:

 Software aspects of data driven systems, i.e. systems where the action is dictated by the presence or availability of data at the inputs of the logical circuits, rather than by sequential instruction execution under supervision of a central clock

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Specification techniques, e.g. Petri nets	G06F 8/10
Data flow analysis during compilation	G06F 8/433
Architectures for data or demand driven systems	G06F 15/82

## G06F 9/4496

# {Unification in logic programming}

#### **Definition statement**

This place covers:

Unification is one of the main ideas behind logic programming, best known through the language Prolog. It represents the mechanism of binding the contents of variables and can be viewed as a kind of one-time assignment.

## G06F 9/4498

# {Finite state machines}

#### **Definition statement**

This place covers:

Program execution implemented by a Finite State Machine. There must be enough technical details about the FSM implementation to allocate the subgroup.

# G06F 9/451

## **Execution arrangements for user interfaces**

## **Definition statement**

This place covers:

- The inner working of user interfaces, in particular graphical user interfaces (GUIs), including:
- · Interaction of the GUI with applications and OSs
- The structure and interaction of software components of GUIs
- Implementation of GUI concepts typically used in operating systems, e.g. desktop metaphors, widgets or windowing mechanisms
- Implementation of GUI automation mechanisms, e.g. record/replay of user interactions on the GUI

## References

## Application-oriented references

User interfaces for testing or debugging software	G06F 11/36
	G06F 16/248, G06F 16/338, G06F 16/34

	G06F 16/954, G06F 16/9577
User interfaces for the field of automation	G05B 19/00

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Methods for a user to interact with the GUI, e.g. scrolling, drag and drop, menus	G06F 3/048
Digital output to a display device	G06F 3/14
Development and generation of source code for user interfaces	G06F 8/38
User interfaces for portable communication terminals, e.g. mobile phones	H04M 1/724

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

User interface	is the space where interaction between humans and machine
	occurs

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

HCI	Human-computer interaction
MMI	Man-machine interaction
СНІ	Computer-human interaction
GUI	Graphical user interface

## G06F 9/452

{Remote windowing, e.g. X-Window System, desktop virtualisation (protocols for virtual reality H04L 67/131)}

## **Definition statement**

This place covers:

Methods to execute and interact with an application, whereby the application's program code runs on the server, and the GUI runs on the client (terminal). The user interacts with the remotely running application through the local GUI. GUI events/commands run back and forth between client and server. All processing is done at the server.

### References

Pseudo-localisation	G06F 11/00
Processing or translation of natural language	G06F 40/40

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Language localisation	internationalisation (i18n), globalisation

## G06F 9/455

# Emulation; Interpretation; Software simulation, e.g. virtualisation or emulation of application or operating system execution engines

## **Definition statement**

This place covers:

The emulation of entities, e.g. operating systems, processors, classified under G06F 9/00.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

In-circuit emulation	G06F 11/36
Dynamic binary instrumentation may use techniques similar to emulators and binary optimizers	G06F 11/3644
Virtual memory	G06F 12/00
Terminal emulation	G06F 13/105
Computer simulation, in which a model of a system under investigation is beng simulated	G06F 30/00

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Emulation	In computing, emulation refers to the duplication and imitation
	of the functions of one computer system/program by another
	computer system/program, different from the first one, so that the emulated behaviour fully or closely resembles the behaviour of the
	original system/program.

# G06F 9/45504

{Abstract machines for programme code execution, e.g. Java virtual machine [JVM], interpreters, emulators}

## **Definition statement**

This place covers:

Software implementation of a machine (computer) that executes programs like a physical machine:

- Java Virtual Machine (JVM);
- Microsoft .NET common language runtime (CLR);
- · Smalltalk virtual machines.

## References

# G06F 9/45512

# {Command shells}

## **Definition statement**

This place covers:

Giving commands to a computer (OS) by means of a (graphical) user interface.

These commands can be given via the command line or by performing actions on GUI objects. The commands are typically interpreted by a command interpreter.

• Scripts, recording and executing GUI command scripts.

# G06F 9/45516

## {Runtime code conversion or optimisation}

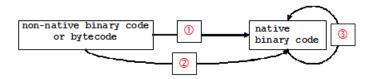

## **Definition statement**

This place covers:

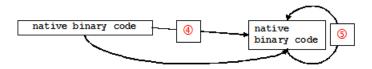

The execution of binary code/bytecode that is not native to the current run-time execution environment by translating the non-native binary code/bytecode into native code just before execution and subsequently executing the native code .

Subsequently, execution can be optimised as follows:

- By performing a retranslation of the non-native binary code/bytecode yielding more optimal native binary code e.g. by taking into account run-time information;
- · By directly transforming the native binary code yielding more optimal native binary code .

The <u>G06F 9/45516</u> also deals with the initial and subsequent run-time transformation of native binary code into more optimal native binary code.

For the purpose of completeness, the <u>G06F 9/45516</u> also deals with the translation of intermediate bytecode to a different intermediate bytecode (e.g. Java bytecode to UCSD P-code). This however, is a more theoretic possibility and will not occur frequently.

The majority of the documents in this class deal with the translation of intermediate bytecode to native binary code and more specifically with the dynamic compilation of Java bytecodes into native code (JIT compilation).

## Relationships with other classification places

• The G06F 9/45516 is the dynamic counterpart of the G06F 8/52

Both classes have the same goal (i.e. translation from one binary format into another) but the point in time when this translation is performed is different: at run-time, just before or during execution (G06F 9/45516) and statically, pre-run-time (G06F 8/52).

- Because the translation in the G06F 9/45516 takes place just before execution, there is less time available
- Difference between <u>G06F 9/45516</u> and <u>G06F 9/3017</u>

Both G06F 9/45516 and G06F 9/3017 deal with run-time translation of binary code. However, in the G06F8/455B4 the translation relates to a program as a whole and is realised by a software translator, whereas in the G06F 9/3017 the translation relates to individual instructions that are about to be executed and is performed by the processor's internal hardware and.

In  $\underline{\mathsf{G06F}\ 9/45516}$ , the processor is fed with the translated, native instructions; it doesn't know anything about the translation that took place. However, in  $\underline{\mathsf{G06F}\ 9/3017}$  the processor is fed with the nonnative instructions; translation into native code takes place on-the-fly (i.e. at the moment the instruction is actually executed by the internal hardware of the processor).

- Difference between <u>G06F 9/45516</u> and <u>G06F 9/45508</u>
- The <u>G06F 9/45508</u> is also related to the execution of binary, non-native code. However, the non-native code is emulated rather than translated: an emulator acts as an virtual machine and interprets the non-native code.

## References

## Limiting references

This place does not cover:

Run-time instruction translation	G06F 9/3017
Profiling per se	G06F 11/34

## G06F 9/4552

# {Involving translation to a different instruction set architecture, e.g. just-in-time translation in a JVM}

# **Definition statement**

This place covers:

Translation of code at runtime prior to executing it natively, e.g. bytecode into native machine code. Dynamic compilation.

#### References

## Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Translation of one binary program to another before the program is ever	G06F 8/52
executed. Static binary translation.	

# G06F 9/45525

# {Optimisation or modification within the same instruction set architecture, e.g. HP Dynamo}

#### **Definition statement**

This place covers:

Optimisations carried out at runtime without changing the instruction set architecture.

## G06F 9/45529

## {Embedded in an application, e.g. JavaScript in a Web browser}

## **Definition statement**

This place covers:

Conversions or optimisations, e.g. done by JavaScript engines or similar plugin technologies built into another execution environment.

#### Informative references

Dynamic loading of plugins/add-ons	G06F 9/44526
------------------------------------	--------------

## G06F 9/45533

# {Hypervisors; Virtual machine monitors}

#### **Definition statement**

This place covers:

- Simultaneously executing multiple operating systems using a Virtual Machine Monitor (VMM). The following passage, taken from US2004230794, provides a good definiton of a VMM: 'A VMM enables plural operating systems to run on a single machine by "virtualizing" the entire machine. Conventionally, an operating system controls the use of the physical hardware resources of a machine (e.g., the memory, the processor, etc.), and thus the actual hardware of the machine is exposed to the operating system. When a VMM is used, however, the machine's hardware (e.g., devices) are only exposed to the VMM. The VMM, then, exposes "virtual" machine components to the operating systems'.In G06F 9/45545, plural operating systems execute simultaneously as guest and host (without a VMM)..
- · Process switching for virtual machines;
- · Handling of non-implemented instructions;
- Address trapping for emulating other memory architectures;
- · Host/guest and mode switching instructions;
- Switching between endian modes (endian conversion on a bus G06F 13/40).

## References

## G06F 9/45537

# {Provision of facilities of other operating environments, e.g. WINE (I/O emulation G06F 13/105)}

## **Definition statement**

This place covers:

Emulation of one OS by another OS

- Simultaneously executing first and second operating systems by executing the second OS as a guest OS on top of the first OS (the host OS). No virtual machine monitor (VMM) is needed. The use of guest and host OSs is described in the following passage, taken from US2004230794: 'Certain techniques allow operating systems to exist side-by-side on the same machine without the use of a virtual machine monitor. One such technique is to have one operating system act as a "host" for the other operating system. (The operating system that the "host" is hosting is sometimes called a "guest.") In this case, the host operating system provides the guest with resources such as memory and processor time '
- · Interrupt handling of other OS
- Non I/O services of other OS, e.g. facilities for emulation of virtual memory
- Memory mapping and address trapping for emulating I/O

## Relationships with other classification places

Associated address trapping is in G06F 9/45533.

## References

This place does not cover:

I/O emulation G06F 13/105

## G06F 9/45541

# {Bare-metal, i.e. hypervisor runs directly on hardware}

## **Definition statement**

This place covers:

A bare-metal hypervisor runs directly on the host's hardware to control the hardware and to manage guest operating systems, e.g. Citrix XenServer, VMware ESX, Microsoft Hyper-V..

# G06F 9/45545

{Guest-host, i.e. hypervisor is an application program itself, e.g. VirtualBox}

#### **Definition statement**

This place covers:

Hypervisor runs within a conventional operating system environment.

## G06F 9/4555

{Para-virtualisation, i.e. guest operating system has to be modified}

## **Definition statement**

This place covers:

Para-virtualisation is a virtualization technique that presents a software interface to virtual machines that is similar but not identical to that of the underlying hardware.

## G06F 9/45554

{Instruction set architectures of guest OS and hypervisor or native processor differ, e.g. Bochs or VirtualPC on PowerPC MacOS}

#### **Definition statement**

This place covers:

Mechanisms to adapt the instruction set of a guest system to the instruction set offered by the underlying hypervisor and/or native processor.

## G06F 9/45558

{Hypervisor-specific management and integration aspects}

## **Definition statement**

This place covers:

• Management and integration aspects of hypervisors.

**Definition statement** 

• Functions needed to manage virtual machines or to integrate them into the execution environment that are specific to a hypervised system, e.g. handling of virtual machine instances, creating, cloning, deleting instances, starting and stopping virtual machines, distributing and migrating instances, managing I/O and storage access, isolating virtual machines for security reasons, managing memory of instances.

# Special rules of classification

The following CPC breakdown codes are used for refined classification. Please also consider classification in the main trunk symbols referenced by the breakdown codes.

## G06F 2009/45562

# {Creating, deleting, cloning virtual machine instances}

#### **Definition statement**

This place covers:

Handling single instantations of virtual machines, e.g. creation from template or copy of another instance.

## G06F 2009/45566

## {Nested virtual machines}

#### **Definition statement**

This place covers:

Virtual machines running within other virtual machines.

## G06F 2009/4557

## {Distribution of virtual machine instances; Migration and load balancing}

## **Definition statement**

This place covers:

Managing the placement of virtual machine instances.

## G06F 2009/45575

# {Starting, stopping, suspending or resuming virtual machine instances}

## **Definition statement**

This place covers:

Network protocols for data switching network services	H04L 67/00
Aspects already covered by <u>G06F 9/48</u> , <u>G06F 9/50</u> , <u>G06F 9/52</u> , <u>G06F 9/54</u>	See special rules of classification of the corresponding classes

# Rule 1

When a document qualifies for one of the groups in the table of rule 2 below, the group G06F 9/46 should not be assigned.

# Rule 2

The following table specifies the group to be assigned:

Technical details on	Group to be assigned
Saving or restoring of program or task context	G06F 9/461
Saving or restoring of program or task context with multiple register sets. This group takes precedence over G06F 9/461	G06F 9/462
Program control block organisation. This group takes precedence over G06F 9/461	G06F 9/463
Structure and arrangements for distributed object oriented systems, e.g. CORBA, Jini, DCOM	G06F 9/465
Transaction processing, namely transactions involving the ACID (Atomicity, Consistency, Isolation, Durability) properties	G06F 9/466

Transactional memory, i.e. transparent support for the definition of regions of code that are considered a transaction, the support being provided either in hardware, software or with hybrid-solutions. This group takes precedence over G06F 9/466. For speculative lock acquisition, G06F 9/528 takes precedence	G06F 9/467
Specific access rights for resources, e.g. using capability register	G06F 9/468

#### Rule 3

The following text specifies the groups which could be assigned in addition to the groups of rule 2 above, to cover further technical details; the group(s) identified as context information should also be checked and assigned, if relevant:

Further technical details on:

The structure of bridges between different distributed object-oriented systems

• Context information: G06F 9/465

The lookup of interfaces and/or the structure of lookup servers / repositories

• Context information: G06F 9/465

The handling of references to remote objects / namespace implementation details within the context of distributed object-oriented systems

• Context information: G06F 9/465

## G06F 9/48

# Program initiating; Program switching, e.g. by interrupt

## **Definition statement**

This place covers:

transfer, initiation or dispatching of tasks, i.e. programs in execution, either locally or within a distributed system

Suspension and resumption at system level (i.e. involving the bootstrapping)	G06F 9/4418
Mere loading of code linked to the initiation	G06F 9/445
Details on the task context structure as well as on its saving and restoring	G06F 9/461
Scheduling in terms of space	See special rules of classification for G06F 9/50

Process migration in the context of load (re-)balancing, without any technically relevant detail on the migration itself	G06F 9/5088
Mere starting of a backup application at a certain date/time	G06F 11/1461
Low level (bus-related) details of interrupt handling and interrupt controllers	G06F 13/24
Mere starting of an antivirus application at a certain date/time	G06F 21/56
Scheduling of human resources	G06Q 10/00

# Rule 1

When a document qualifies for one of the groups in the table of rule 2 below, the group G06F 9/48 should not be assigned.

Rule 2

The following table specifies the group to be assigned:

Technical details on	group to be assigned
Initiation of a task by means of an interrupt, i.e. the aspects of handling/servicing an interrupt	G06F 9/4812
Interrupt Interrupt priority mechanisms. This group takes precedence over G06F 9/4812	G06F 9/4818
InitiationI of a task by means of an timer related interrupt. This group takes precedence over G06F 9/4812	G06F 9/4825
InitiationI of a task by means of an interrupt with variable priority. This group takes precedence over G06F 9/4812	G06F 9/4831
Initiation of a task by means of an interrupt with variable priority, said priority being time dependent. This group takes precedence over G06F 9/4812 and G06F 9/4831	G06F 9/4837
Initiation, transfer and dispatch of a task, i.e. a program in execution, by another program; creation, e.g. fork() system call, and initiation, e.g. exec() system call, of a task / process / thread, virtual machine in the same or different machine	G06F 9/4843
Task life-cycle, e.g. stopping, restarting, resuming execution. This group takes precedence over G06F 9/4843. For scheduling algorithms and internal operation of a scheduler, G06F 9/4881 takes precedence	G06F 9/485
Resuming the execution of a task on a different machine, i.e. migration. This group takes precedence over <u>G06F 9/4843</u> . This group takes precedence over <u>G06F 9/485</u> . For migration for load balancing purposes, <u>G06F 9/5088</u> takes precedence	G06F 9/4856

Mobile agents, i.e. tasks specifically designed to migrate. This group takes precedence over G06F 9/4843. This group takes precedence over G06F 9/485. This group takes precedence over G06F 9/4856. For cloning and replication of mobile agents, only G06F 9/4868 should be assigned. For migration policy, e.g. auction, contract negotiation, of mobile agents, only G06F 9/4875 should be assigned.	G06F 9/4862
Scheduling strategies for dispatcher, e.g. round robin, multilevel priority queues; internal operation of a scheduler	G06F 9/4881
Algorithms for real-time scheduling of processes, i.e. scheduling taking into account the deadlines of the applications being executed. This group takes precedence over G06F 9/4843. This group takes precedence over G06F 9/4881.	G06F 9/4887
Power and heat aware scheduling of tasks. This group takes precedence over G06F 9/4843. This group takes precedence over G06F 9/4881	G06F 9/4893

## Rule 3

The following text specifies the groups which could be assigned in addition to the groups of rule 2 above, to cover further technical details; the group(s) identified as context information should also be checked and assigned, if relevant:

Further technical details on:

Exception handling

• Context information: G06F 9/4812

Application starting, stopping, resuming

Context information: G06F 9/485

Scheduling of tasks on multiprocessor systems

Context information: G06F 9/4881, G06F 9/4887, G06F 9/4893

Scheduling of a set of tasks by taking into account precedence and dependency constraints, or time and/or occurrence of events

Context information: <u>G06F 9/4881</u>, <u>G06F 9/4887</u>, <u>G06F 9/4893</u>

Scheduling of a set of tasks by taking into account constraints on resources, resource based scheduling of tasks

Context information: <u>G06F 9/4881</u>, <u>G06F 9/4887</u>, <u>G06F 9/4893</u>

Internals of a task scheduler

• Context information: <u>G06F 9/4881</u>, <u>G06F 9/4887</u>, <u>G06F 9/4893</u>

## Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

[scheduling in terms of time]	[with the acceptation of task scheduling, i.e. when to assign a task
	to a computing unit]

[scheduling in terms of space]	[with the acceptation of resource scheduling, i.e. which resource(s)
	to allocate and how to partition them]

It is the first interpretation, the one which can be found in the context of the G06F 9/48

## G06F 9/50

# Allocation of resources, e.g. of the central processing unit [CPU]

# **Definition statement**

This place covers:

selection, allocation and de-allocation of hardware and/or software resources, like servers, processes, threads, CPUs, memory; combination and/or partitioning of resources, e.g. cloud computing, hypervisors and logical partitions; mapping of tasks onto parallel / distributed machines; load balancing and re-balancing of resources in distributed systems.

## References

## Limiting references

This place does not cover:

Specific details on power distribution and power saving	G06F 1/3203
Allocation of disk resources and storage resources in general not being RAM	G06F 3/0604
Scheduling of printer jobs	G06F 3/1296
Specific details on emulation and internal functioning of a virtual machine	G06F 9/455
Mapping of tasks onto multi-processor systems carried out at compile-time	G06F9/45M1

Network protocols for data switching network services	H04L 67/00
Allocation of resources within a printer / multifunctional peripheral	H04N 1/00

# Special rules of classification

Rule 1

When a document qualifies for one of the classes in the table of rule 2 below, the class <u>G06F 9/50</u> should not be assigned.

Rule 2

The following table specifies the class to be assigned:

Technical details on:	Class to be assigned:
Allocation of resources to service a request	G06F 9/5005
Allocation of resources to service a request, the resources being hardware resources other than CPUs, Servers and Terminals This class takes precedence over G06F 9/5005	G06F 9/5011
Allocation of memory resources to service a request This class takes precedence over <u>G06F 9/5005</u> This class takes precedence over <u>G06F 9/5011</u> for documents detailing both the allocation and release of memory resources, the class <u>G06F 9/5022</u> should also be assigned	G06F 9/5016
Release of resourcesThis class takes precedence over G06F 9/5005 This class takes precedence over G06F 9/5011 For documents detailing both the allocation and release of memory resources, the class G06F 9/5016 should also be assigned	G06F 9/5022
Allocation of processing resources, e.g. CPUs, Servers, Terminals, processes, threads, virtual machines	G06F 9/5027
A llocation of processing resources by considering data affinity This class takes precedence over <u>G06F 9/5005</u> This class takes precedence over <u>G06F 9/5027</u>	G06F 9/5033
A llocation of processing resources by considering the execution order of a plurality of tasks, e.g. taking priority or time dependency constraints into consideration. Candidates for this group are documents dealing with requests for composite (web) services, where the various components should execute in a certain order and resources for said execution should be assigned accordingly. Also included are documents dealing with "workflow" like systems, where a request to "execute" a project definition, comprising a set of interrelated actions, is sent to a server This class takes precedence over G06F 9/5005 This class takes precedence over G06F 9/5027	G06F 9/5038
A llocation of processing resources by considering hardware capabilities This class takes precedence over G06F 9/5005 this class takes precedence over G06F 9/5027	G06F 9/5044
Allocation of processing resources by considering the load This class takes precedence over <u>G06F 9/5005</u> This class takes precedence over <u>G06F 9/5027</u>	G06F 9/505
Allocation of processing resources by considering software capabilities, namely software resources associated or available to the machine, e.g. Web services offered by a specific machine This class takes precedence over <a href="#">G06F 9/5005</a> This class takes precedence over <a href="#">G06F 9/5027</a>	G06F 9/5055
Partitioning or combining of resources This class should contain also documents dealing with cluster membership, i.e. assignment of a server to a certain group based on some criteria (see exemplary documents WO0156785, EP0805393).	G06F 9/5061
Algorithms for mapping a plurality of inter-dependent sub-tasks onto a plurality of physical CPUs This class takes precedence over G06F 9/5061	G06F 9/5066

Grid computing, cloud computing With the expression grid / cloud computing it is meant an environment where multiple services are offered by the various members of the grid (often making use of idle periods), said members being usually located over a large scale network. Candidate documents should have at least one of the following concepts: i) set up of a grid, e.g. registering a new member, re-organizing the grid; ii) usage of a service in the grid, e.g. locating the member, servicing a request. This class takes precedence over G06F 9/5061	G06F 9/5072
Logical partitioning of resources; management and configuration of virtualized resources This group deals with the creation and management (e.g. allocation) of logical partitions and resulting virtual machines in multiprocessor systems; it also deals with the concept of virtualization in general, namely the mere management (e.g. creation, deletion) of an abstract, logical representation of a resource and its configuration (e.g. re-definition of its behaviour). This class takes precedence over G06F 9/5061 For documents detailing the migration of a virtual machine to a different node, the class G06F 9/4856 should also be assigned	G06F 9/5077
Techniques for balancing or rebalancing the load in a distributed system by taking into account the load of the whole system	G06F 9/5083
Techniques for balancing or rebalancing the load in a distributed system by migrating tasks / jobs / virtual machines This class takes precedence over <a href="G06F-9/5083">G06F-9/5083</a> For documents detailing the migration of a task/job/virtual machine to a different node, the class <a href="G06F-9/4856">G06F-9/4856</a> should also be assigned	G06F 9/5088
Allocation of resources based on power and heat considerations	G06F 9/5094

### Rule 3

The following table specifies the classes which could be assigned in addition to the classes of rule 2 above, to cover further technical details; the class(es) identified as Context information should also be checked and assigned, if relevant:

## Further details on:

Allocation based on performance criteria

- Class to be assigned: S06F209/5001
- Context information: <u>G06F 9/5027</u>, <u>G06F 9/5033</u>, <u>G06F 9/5038</u>, <u>G06F 9/5044</u>, <u>G06F 9/505</u>, G06F 9/5055

## Allocation based on proximity

- Class to be asigned: S06F209/5002
- Context information: G06F 9/5027, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

## Indication of availability of resources

- Class to be assigned: **S06F209/5003**
- Context information: All groups belonging to G06F 9/50

Enforcing and/or taking into account lower and/or upper ceilings on resource usage in the context of resource allocation

- Class to be assigned: S06F209/5004
- Context information: All groups belonging to G06F 9/50

#### G06F 9/50 (continued)

Special rules of classification

#### Cluster membership

Class to be assigned: S06F209/5005
Context information: G06F 9/5061

Dependency or time-specific aspects which are taken into account during the allocation

- Class to be assigned: S06F209/5006
- Context information: G06F 9/5038

Allocation of low-level processor resources, e.g. logical units, registers, cache lines, decoding stages

- Class to be assigned: S06F209/5007
- Context information: <u>G06F 9/5011</u>, <u>G06F 9/5016</u>, <u>G06F 9/5022</u>

Monitoring techniques used in conjunction with the CPU / thread allocation

- Class to be assigned: S06F209/5008
- Context information: All groups belonging to G06F 9/50

Offloading computations (e.g. because lacking some of the necessary capabilities)

- Class to be assigned: S06F209/5009
- Context information: <u>G06F 9/5027</u>, <u>G06F 9/5033</u>, <u>G06F 9/5038</u>, <u>G06F 9/5044</u>, <u>G06F 9/505</u>, G06F 9/5055

#### Allocation based on priority

- Class to be assigned: G06F 2209/5011
- Context information: G06F 9/5027, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

Creation, use, management of pool of resources

- Class to be assigned: S06F209/5010
- Context information: All groups belonging to G06F 9/50

Controlling aspects of an already submitted request, e.g. polling for a status, deleting / modifying the request

- Class to be assigned: G06F 2209/5013
- Context information: G06F 9/5027, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

Reservation of resources so as to have them ready at the time of the actual allocation

- Class to be assigned: G06F 2209/5014
- Context information: All groups belonging to G06F 9/50

Selection, by a broker, based on the submitted request, of an appropriate server via a registry or a yellow pages server

- Class to be assigned: G06F 2209/5015
- Context information: G06F 9/5027, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

## Session management

- Class to be assigned: G06F 2209/5016
- Context information: G06F 9/5027, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

## Task decomposition

- Class to be assigned: G06F 2209/5017
- Context information: G06F9/50A6, G06F 9/5033, G06F 9/5038, G06F 9/5044, G06F 9/505, G06F 9/5055

Selection of a thread / process within a multithreaded / multiprocessing machine, said selection being aimed to service a request

- Class to be assigned: G06F 2209/5018
- Context information: <u>G06F 9/5027</u>, <u>G06F 9/5033</u>, <u>G06F 9/5038</u>, <u>G06F 9/5044</u>, <u>G06F 9/505</u>, G06F 9/5055

Workload prediction within the context of CPU / process allocation and load rebalancing

- Class to be assigned: G06F 2209/5019
- Context information: G06F 9/5083, G06F 9/5088

Workload threshold within the context of CPU / process allocation and load rebalancing

- Class to be assigned: G06F 2209/5019
- Context information: <u>G06F 9/5083</u>, <u>G06F 9/5088</u>

remote execution techniques whereby program code is executed remotely from the client that initiated the execution and the client provides the code to the remote machine

- Class to be assigned: S06F209/5409
- Context information: All groups belonging to G06F 9/50

## Synonyms and Keywords

The expression "scheduling", in the patent- and non patent-documentation, can have two distinct meanings when referring to task and resources:

- 1) scheduling in terms of time, with the acceptation of task scheduling, i.e. when to assign a task to a computing unit,
- 2) scheduling in terms of space, with the acceptation of resource scheduling, i.e. which resource(s) to allocate and how to partition them.

It is the second interpretation, the one which can be found in the context of G06F 9/50.

# G06F 9/52

## Program synchronisation; Mutual exclusion, e.g. by means of semaphores

## **Definition statement**

This place covers:

Arbitrating access from tasks to shared resources (e.g. mutual exclusion), synchronising the execution of tasks with respect to each others (e.g. producer - consumer); a task is defined here as a program in execution.

#### References

#### Informative references

Speculative instruction issuing and/or data consistency	G06F 9/3842, G06F 9/3834
Transaction processing	G06F 9/466
Arbitration of access on a bus	G06F 13/14
Concurrency management in a database	G06F 16/2308

#### Rule 1

When a document qualifies for one of the groups in the table of rule 2 below, the group G06F 9/52 should not be assigned

#### Rule 2

The following table specifies the group to be assigned:

Technical details on	Group to be assigned
Barrier synchronisation	G06F 9/522
Algorithms to detect and / or avoid deadlocks when tasks interact with each other	G06F 9/524
Mutual exclusion algorithms, specific implementations of locks and other means to ensure a "correct" (from the concurrency point of view) access to a shared resource	G06F 9/526
Speculative execution beyond synchronisation primitives (e.g. busy lock). This group takes precedence over G06F 9/526; e.g. if a document discloses a mutual exclusion algorithm involving speculative execution beyond busy locks, then it should be classified only in the G06F 9/528 and not also in the G06F 9/526	G06F 9/528

#### Rule 3

The following text specifies the groups which could be assigned in addition to the groups of rule 2 above, to cover further technical details:

Further technical details on:

Low level features of atomic instructions (e.g. test & set) used to implement locks / mutual exclusion primitives

• Context information: <u>G06F 9/526</u>, <u>G06F 9/528</u>

Tokens (e.g. cooperative locking), token managers and lock managers

• Context information: G06F 9/526, G06F 9/528

Multi-mode locks, i.e. with locks specifying also a mode (e.g. read-write)

Context information: G06F 9/526, G06F 9/528

## G06F 9/54

# Interprogram communication

## **Definition statement**

This place covers:

Communication between tasks, i.e. programs, processes, threads in execution, either on the same machine or on different ones, where the multiprogramming aspect is relevant, e.g. Inter-Process-Communication.

## References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Communication between a device and a CPU without any technically relevant detail on multiprogramming concepts or with device specific details	G06F 3/00, G06F 13/00, G06F 13/102 (for device drivers)
Interaction of the user with the system, i.e. the GUI, and not between the Processes / applications subsequent to the user interaction	G06F 3/048
Communication which does not involve multiprogramming concepts, e.g. invocation of a subroutine	G06F 9/44
Pattern-adapters	G06F 9/44
Non-remote method invocation between objects	G06F 9/449
Architectural details, e.g. interface repositories, object adapters, on distributed object-oriented systems, e.g. CORBA, DCOM Communication-specific details of the remote method invocation should (also) be classified in G06F 9/548	G06F 9/465
Allocation of a remote service to a client	G06F 9/50
Communication between tasks but predominant aspect peculiar of another field, e.g. monitoring, information retrieval on the web, software download and installation	G06F 11/30, G06F 16/95, G06F 8/65
Addressing memory	G06F 12/02
Hardware mechanisms for inter-CPU communication	G06F 15/163
Collaborative editing on a file without any technically relevant details on the event handling aspect	G06F 40/10, G06Q 10/10
Cryptographic protocols	H04L 9/00
Event management relating to network management, e.g. alarms produced by network devices, and no technically relevant details on the multiprocessing aspect is present	H04L 41/06
Messages being distributed over a network, i.e. e-mails, instant messaging	H04L 51/00, G06Q 10/107
Network security protocols	H04L 63/00
Protocols for real-time services in data packet switching networks	H04L 65/00
Network protocols for data switching network services	H04L 67/00

# Special rules of classification

# Rule 1

When a document qualifies for one of the groups in the table of rule 2 below, the group G06F 9/54 should not be assigned.

#### Rule 2

The following table specifies the group to be assigned:

Technical details on	Group to be assigned
Adapter mechanisms e.g. between incompatible applications	G06F 9/541

Communication between tasks, either on the same machine or on different ones, by subscribing to events and issuing event notifications when certain events happen, e.g. Event Management Systems, Unix alarms; communication aspects related to the broadcasting of the notifications	G06F 9/542
User-generated data transfer from the process / application point of view, e.g. clipboards, dynamic data exchange (DDE), object linking and embedding (OLE)	G06F 9/543
Communication of processes via buffers, shared memory, pipes, sockets and the like	G06F 9/544
Communication between tasks residing in different layers e.g. user- and kernel-space	G06F 9/545
Communication of processes via a message passing system, i.e. messaging middleware, and the inherent technicalities, e.g. message structure or queue handling; delivery of messages according to preferences of the recipients (which have to be processes)	G06F 9/546
Implementation of Remote Procedure Calls, e.g. stubs, (un-)marshalling of parameters, namely invocation of a procedure at a remote location; lightweight RPC, i.e. procedure call between protection domains / different address spaces on a single machine	G06F 9/547
Implementation of Remote Method Invocations, i.e. details which are peculiar to RPC between (mainly Java and COM) objects, e.g. object serialization, stub / proxy download. This group takes precedence over G06F 9/547.	G06F 9/548

## Rule 3

The following text specifies the groups which could be assigned in addition to the groups of rule 2 above, to cover further technical details:

Further technical details on:

Communication aspects related to task execution in a client-server system

Context information: All groups belonging to G06F 9/54

Interception of communications between tasks / layers

• Context information: All groups belonging to G06F 9/54

Handling of events within a single system, e.g. Unix alarms

• Context information: G06F 9/542

Distributed event management systems or handling of events produced in a distributed system

• Context information: G06F 9/542

Event handling related to the execution of a GUI and as long as the event handling aspect is technically relevant

• Context information: G06F 9/542

Broadcasting / multicasting and sequence related problems of event related messages and as long as the network aspect, if any, is not predominant

• Context information: G06F 9/542

Exchange of messages between processes by using a Message Oriented Middleware, e.g. Java Messaging Services

Context information: G06F 9/546

Particular techniques for handling message queues (or similar structures)

Context information: G06F 9/546

Remote execution techniques whereby program code is executed remotely from the client that initiated the execution and the client provides the code to the remote machine

Context information: All groups belonging to G06F 9/54

## G06F 11/00

Error detection; Error correction; Monitoring (error detection, correction or monitoring in information storage based on relative movement between record carrier and transducer <u>G11B 20/18</u>; monitoring, i.e. supervising the progress of recording or reproducing <u>G11B 27/36</u>; in static stores <u>G11C 29/00</u>)

## **Definition statement**

This place covers:

- Error avoidance (G06F 11/004)
- Identification related to error detection / correction or monitoring (G06F 11/006)
- Reliability and availability analysis of computing systems (G06F 11/008)
- Error detection and/or correction (G06F 11/07 and subgroups)
- Detection or location of defective computer hardware by testing at a time outside of "normal operating mode", e.g. during standby, idle time or at power on (G06F 11/22 and subgroups)
- Checking the correct order of processing (G06F 11/28)
- Monitoring on computing systems (G06F 11/30 and subgroups)
- Preventing errors by analysing, debugging and testing software (G06F 11/36 and subgroups)

## References

#### Limiting references

This place does not cover:

Error detection, correction or monitoring in information storage based on relative movement between record carrier and transducer	G11B 20/18
Supervising the progress of recording or reproducing	G11B 27/36
Error detection, correction or monitoring in static stores	G11C 29/00

Implementation details of particular digital data processing techniques applied to error detection, error correction or monitoring are classified in the relevant subgroups of G06F 11/00.

The error detection/correction process in neural networks is also covered (G06F 11/1476).

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Fault	Physical defect, imperfection, or flaw that occurs within some hardware component, or logical defect of a piece of software.  Essentially, the definition of a fault, as used in the fault tolerance community, agrees with the definition found in the dictionary.  Faults may be permanent, transient or intermittent.
Error	The logical manifestation of a fault, observable in terms of incorrect instructions of or corrupted data in a (computer) system. E.g. a fault in a DRAM cell will never be observed if the memory location is never accessed. Specifically, an error is a deviation from accuracy or correctness.
Failure	The incorrect functioning of a system as perceivable by a user or the system's environment as a consequence of an error. A failure is the non-performance, the untimely performance or the performance in a subnormal quantity or quality of some action that is due or expected.
Redundant hardware	Additional hardware for performing the same function as another hardware part, provided that in faultless operation you could renounce on either hardware parts of the system without loosing functionality.
Data representation	A physical or logical encoding (scheme) for data, which allows the latter to be processed, stored or transmitted by a machine.
Redundancy in data representation	A representation of data using more resources than strictly necessary to encode the desired information such that in the error free situation one could renounce to some of said resources without loosing information.
Redundancy in operation	Performing (a set of) operations more than once, or performing sequentially different implementations of a particular function, or performing additional operations which (allow to) restore a system in a state from which its correct operation can be resumed after a failure.

Time diversity	the concept to have an redundant system in which one of the redundant components operates with a delay with respect to the other in order to avoid common mode failures that would affect both redundant components in the same way at the same time, thereby not being detectable/correctable.
Master-checker setup	A redundant configuration in which a master CPU drives the system. The checker CPU is synchronized (often at clock level) with the master. It processes the input data stream as the master (and often also the very same program). Whenever the master drives an output signal, the checker compares its own value with the data written by the master. A mismatch triggers an error signal. The master-checker mode is supported in many modern microprocessors by a comparator integrated into the pin driver circuitry, thus reducing the external logic to a few chips for interfacing the error signals." The master-checker system generally gives more accurate answers by ensuring that the answer is correct before passing it on to the application requesting the algorithm being completed. It also allows for error handling if the results are inconsistent. Depending on the merit of a correct answer, a checker-CPU may or may not be warranted. In order to alleviate some of the cost in these situations, the checker-CPU may be used to calculate something else in the same algorithm, increasing the speed and processing output of the CPU system." There are two possible configurations: Master-Listener and Cross-Coupled. The Master-Listener lock step configuration pairs two processors, with one as a complete Master and the other as a complete Listener, the latter having disabled output drivers. In the Cross-Coupled configuration, one of the processors, the SI-Master, drives the system interface bus, while the other processor, the SC-Master has disabled output drivers for the secondary cache interface bus while the SC-Master has disabled output drivers for the system interface bus while the SC-Master has disabled output drivers for the system interface bus while
Normal operating mode	The operation of a system or software once it is deployed and provides the desired service as opposed to its development, maintenance, test or idle time.
Fault masking	Hiding the presence of an fault to the user or the environment of a (computer system by means of some sort of redundancy such that the perceived system functionality is not affected.
Active fault masking	Taking particular actions (e.g. reconfiguration, failover) not performed in the error free situation to mask a fault.
Passive fault masking	When a system operates such that no particular action is necessary to mask a fault because all necessary operations are constantly performed independently of the presence of a fault (e.g. majority voting).
Normal operating mode	the operation of a system or software once it is deployed and provides the desired service as opposed to its development, maintenance, test or idle time.
Interconnections	are physical media and may be of point-to-point type or of bus type. Two interconnections are only considered redundant if: they both physically connect the same nodes, wherein nodes are the source producing or the final destination consuming the data to be transmitted, and are configured to perform the same data transmissions.

Glossary of terms

Monitoring	monitoring refers to an extra functionality for observing properties of a running computing system in its normal operating condition without inputting test data
Mirrored data	Two copies of the data where it is supposed that both copies contain the same data at any moment.
Backed up data	The second copy of the data reflects the data of the first copy at a particular moment.

# G06F 11/002

## {protecting against parasitic influences, e.g. noise, temperatures}

## Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

## G06F 11/004

# {Error avoidance (G06F 11/07 and subgroups take precedence)}

## **Definition statement**

This place covers:

All measures taken to prevent an error from happening. This can either be by preventing the fault from being present or by ensuring that the presence of the fault will not lead to an error.

## References

## Limiting references

This place does not cover:

Measures in response to the occurence of a fault, e.g. measures	G06F 11/07
designed to limit the impact of the error	

# Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

This subgroup is only to be used for subject-matter for which no other technique (like fault-masking based on redundancy) to respond to the occurrence of a fault applies. If techniques corresponding to G06F 11/07 and subgroups apply, the subject-matter must be classified there instead.

## G06F 11/006

# {Identification (G06F 11/2289 takes precedence)}

## Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

# {Reliability or availability analysis}

## **Definition statement**

This place covers:

Reliability theory describes the probability of a system completing its expected function during an interval of time. In reliability theory availability is the degree to which a system is in a specified functioning condition. In the literature various definitions can be found. One well established defines availability as "the probability that a system is operating at a specified time t", Barlow and Proschan: Mathematical Theory of Reliability (1975). A simple representation of availability is a ratio of the expected value of the uptime of a system to the aggregate of the expected values of up and down time. For example in the case of systems having a MTBF (Mean Time Between Failure) and MTTR (Mean Time to Recovery), availability = MTBF/(MTBF + MTTR). Typical terminology that the group contains: error prediction, failure rate, predictive maintenance, longevity, etc. A lot of documents deal with pure theory and propose new formula for better assessing a system in terms of reliability.

Forecasting, planning	G06Q 10/00
-----------------------	------------

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Reliability	The term refers to the ability of a system or component to perform its required functions under stated conditions for a specified period of time.
Availability	The ratio of the total time a functional unit is capable of being used during a given interval to the length of the interval.
Downtime	The term downtime is used to refer to periods when a system is unavailable.
Uptime	Part of active time during which an equipment, machine, or system is either fully operational or is ready to perform its intended function.
MTBF	Mean Time Between failure is the predicted elapsed time between inherent failures of a system during operation.
MTTF	Mean Time to Failure is the time taken for a part or system to fail for the first time.
MTTR	Mean Time To Repair is a basic measure of the maintainability of repairable items. It represents the average time required to repair a failed component or device.
MTTR	Mean Time To Recovery is the average time that a device will take to recover from any failure.

# Responding to the occurrence of a fault, e.g. fault tolerance

## **Definition statement**

This place covers:

- Error detection/correction on computing systems using redundancy in data representation (also includes RAID systems involving parity) (G06F 11/08 and subgroups).
- Error detection/correction on computing systems using redundancy in operations (G06F 11/14 and subgroups).
- Error detection/correction on computing systems using redundancy in hardware (<u>G06F 11/16</u> and subgroups).
- Error or fault processing without redundancy (G06F 11/0703 and subgroups).
- Safety measures (G06F 11/0796)

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Fault	Physical defect, imperfection, or flaw that occurs within some hardware component, or logical defect of a piece of software. Essentially, the definition of a fault, as used in the fault tolerance community, agrees with the definition found in the dictionary. Faults may be permanent, transient or intermittent.
Error	The logical manifestation of a fault, observable in terms of incorrect instructions of or corrupted data in a (computer) system. E.g. a fault in a DRAM cell will never be observed if the memory location is never accessed. Specifically, an error is a deviation from accuracy or correctness.
Failure	The incorrect functioning of a system as perceivable by a user or the system's environment as a consequence of an error. A failure is the non-performance, the untimely performance or the performance in a subnormal quantity or quality of some action that is due or expected.
Redundant hardware	Additional hardware for performing the same function as another hardware part, provided that in faultless operation you could renounce on either hardware parts of the system without loosing functionality.
Data representation	A physical or logical encoding (scheme) for data, which allows the latter to be processed, stored or transmitted by a machine.
Redundancy in data representation	A representation of data using more resources than strictly necessary to encode the desired information such that in the error free situation one could renounce to some of said resources without loosing information.
Redundancy in operation	Performing (a set of) operations more than once, or performing sequentially different implementations of a particular function, or performing additional operations which (allow to) restore a system in a state from which its correct operation can be resumed after a failure.
Normal operating mode	The operation of a system or software once it is deployed and provides the desired service as opposed to its development, maintenance, test or idle time.

Fault masking	Hiding the presence of an fault to the user or the environment of a (computer system by means of some sort of redundancy such that the perceived system functionality is not affected.
Active fault masking	Taking particular actions (e.g. reconfiguration, failover) not performed in the error free situation to mask a fault.
Passive fault masking	When a system operates such that no particular action is necessary to mask a fault because all necessary operations are constantly performed independently of the presence of a fault (e.g. majority voting).
Mirrored data	Two copies of the data where it is supposed that both copies contain the same data at any moment.
Backed up data	The second copy of the data reflects the data of the first copy at a particular moment.

{Error or fault processing not based on redundancy, i.e. by taking additional measures to deal with the error or fault not making use of redundancy in operation, in hardware, or in data representation}

# **Definition statement**

This place covers:

The methods for error/fault processing on computing systems in normal operating mode that do not imply the use of any redundancy techniques. The error/fault processing, as it is defined in the subgroup, comprises one or more of the following steps:

- the error detection step (G06F 11/0751 and subgroups)
- the error/fault reporting/storing step (G06F 11/0766 and subgroups)
- the root cause analysis step of the error/fault (G06F 11/079)
- the remedying step (G06F 11/0793), wherein:
- the error/fault reporting/storing refers to collecting/storing of information related to the error/fault (e.g. a performing a memory dump after detecting an error).
- the root cause analysis of an error aims at identifying the initial cause of an error/fault.
- the remedying step refers to the actions taken on the computing system in order to overcome an error/fault.

# Special rules of classification

A document classified in <u>G06F 11/0703</u> - <u>G06F 11/0793</u> must receive at least one classification for the "functional aspect" and at least one classification for the "architectural context" according to the two following actions.

Action 1 – Classifying the functional aspect (see groups G06F 11/0751 - G06F 11/0793):

- Classifying the document in a subgroup corresponding to the most relevant functional aspect of the error/fault processing described in the document;
- <u>G06F 11/0751</u> and its subgroups for the function of error/fault detection, e.g. comparing data to an error threshold:
- <u>G06F 11/0766</u> and its subgroups for the function of error/fault reporting/storing, e.g. performing a memory dump after detecting an error;
- <u>G06F 11/079</u> for the function of root cause analysis, e.g. determining the first error event causing the others;
- <u>G06F 11/0793</u> for the function of error/fault remedying, e.g. executing a specific interrupt handler to clear the error/fault:
- A document can be classified in more than one group of the list defined above based on details of different functional aspects disclosed in the document.

Action 2 – Classifying the architectural context (see groups G06F 11/0706 - G06F 11/0748):

- Classifying the document in a subgroup ) corresponding to the most relevant architectural context described in the document:
- A document can be classified in more than one group under <u>G06F 11/0706</u> based on details of different architectural contexts disclosed in the document;
- In case the document does not disclose any specific architectural context details or only refers to a general computer, the generic head group, G06F 11/0706, should be used.

# {Safety measures, i.e. ensuring safe condition in the event of error, e.g. for controlling element}

#### **Definition statement**

This place covers:

A safe computer system protects its user(s) and/or environment from hazards whether its intended function is performed correctly or not. This group deals with measures taken to ensure that a computer-based system stays safe (i.e. does not present a danger to persons or its environment) when it is no longer able to provide its normal functionality due to the presence of an error. This requirement typically occurs in many real-time control systems. The subject-matter of is group is different from fault-masking since the latter attempts to maintain the desired functionality of a system in the presence of faults whereas this group relates to ensuring a safe condition when faults cannot be masked, thereby degrading the desired system functionality.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

If such a system continues to operate albeit with degraded hardware or	G06F 11/142
software functionality, additional classification symbols in the appropriate	
subgroups may be necessary.	

# Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

## G06F 11/08

# Error detection or correction by redundancy in data representation, e.g. by using checking codes

## **Definition statement**

This place covers:

Documents where the error detection/correction in a computer system is done by redundancy in the representation of the data.

Most often this redundancy arises from the fact that more bits are used to represent the data than strictly necessary. However, these groups cover as well cases where the data is stored twice, but in different formats (e.g. the second time using inverse logic).

However, subject-matter where 2 (or more) identical copies of the data are stored, is not treated here (see informative references)

	<u>G06F 11/2053</u>

# Special rules of classification

Generally only 1 class is given. Only invention information is classified.

## G06F 11/10

# Adding special bits or symbols to the coded information, e.g. parity check, casting out 9's or 11's

## **Definition statement**

This place covers:

Subject matter where more bits are used to represent the data than strictly necessary, however without representing the data twice (or more often).

Subject-matter dealing with host-to-memory or host-to-host transfers is classified in this group per se, except when the protection is on the level of blocks of data (which is in G06F 11/1004).

## References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Protecting a block of data words  G06F 11/1004	
--	--

# Special rules of classification

As soon as the redundant representation is stored on storage, the subject-matter should be classified in <u>G06F 11/1076</u> and subgroups and not in other subgroups. This is independent of how the redundant representation is determined or what representation is used. Group is not used for classification.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Memory	solid state devices used as main memory which are either directly addressable by the associated CPU (meaning that they are located on the high speed bus), or are not addressable internal memories (such as registers and buffers). As such, memory is different from storage.
Storage	media from which data needs first to be loaded before it can be used for computing.

{to protect a block of data words, e.g. CRC or checksum (G06F 11/1076 takes precedence; security arrangements for protecting computers or computer systems against unauthorized activity G06F 21/00)}

## **Definition statement**

This place covers:

The use of checking codes on bigger units of data than a single word to detect the presence of errors in the data.

This group does not cover correction of data.

In this group, it is irrelevant for what purpose the checking is being used (e.g. for storing the data in memory, for transmission of the data to another component in the computing system, ...) as long as it is related to error detection.

Using checking codes in data communication	H04L 1/00

## G06F 11/1008

{in individual solid state devices (G06F 11/1004 takes precedence)}

## **Definition statement**

This place covers:

That subject-matter where the error detection and/or correction is done on data stored in a single solid state device (i.e. the detection/correction is done when reading data from or writing data into the memory). It is independent of what function the solid state device has in the system. The relevant criterium is the type of component on which the data is stored (i.e. solid state devices in contrast to disks, tapes or other storage devices with moving components).

## G06F 11/1076

# {Parity data used in redundant arrays of independent storages, e.g. in RAID systems}

#### **Definition statement**

This place covers:

Redundancy using parity calculation and stripping in redundant arrays of storage devices such as:

- Hard Drives (e.g. RAID)
- Semiconductor memories (e.g. RAID of SSD/Flash disks)
- Optical Drives (e.g. RAID in ODD archives)
- Tape (e.g. RAIT)

# Relationships with other classification places

Mirroring in RAID: G06F 11/2053

Use of parity in memories which do not constitute a redundant array and are close to the processor (e.g. ECC or arithmetic code in a semiconductor memory on the high speed bus): G06F 11/1008

## References

## Limiting references

This place does not cover:

Control as such of RAID system	G06F 3/0604
Mirroring	G06F 11/2053
Redundancy on a disk used for reproduction	G11B 20/1833

## Special rules of classification

If the document can be classified in a subgroup of the <u>G06F 11/1076</u>, then it should not appear in the head subgroup. Only those documents which cannot be classified in one or several subgroups (e.g. <u>G06F 11/108</u>, <u>G06F 11/1084</u> etc) have to be classified in the head subgroup.

Special rules of classification

It is important to evaluate whether the parity calculation aspect is present and if specifics about fault recovery / rebuilding are present in the document. If such topic is not present of if the document talks about general parity aspects mixed with other topics, the Indexing Code groups should be used.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

RAID	Redundant Array of Independent Disks is a technique for implementing fault tolerance in storage devices.
Rebuild	Action of regenerating lost data from redundant data present in available drives / memories.
JBOD	Just a Bunch Of Disks represent a group of disks without particular redundant scheme implemented.

## G06F 11/1084

# {Degraded mode, e.g. caused by single or multiple storage removals or disk failures}

## **Definition statement**

This place covers:

Using the parity to reconstruct data which would otherwise have been lost when a storage device is failing or is removed.

When the reconstruction takes place once a new disk is available, G06F 11/1092 subgroup is used.

When the reconstruction takes place on a spare disk that was available, <u>G06F 11/1088</u> subgroup is used.

#### References

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

RAID	Redundant Array of Independent Disks is a technique for	
	implementing fault tolerance in storage devices.	

## G06F 11/14

# Error detection or correction of the data by redundancy in operation (G06F 11/16 takes precedence)

## **Definition statement**

This place covers:

Although not fully consistent with the title of this group we consider that prophylactic additional savingrelated measures like check-pointing, backing-up or state copying, which are performed before the

occurrence of a fault in order to be able to recover or restore (at least partially) in case a fault occurs in the future, and which do not rely on hardware redundancy, are to be classified under this group.

The corresponding reverse operations of restoring and/or recovering and/or rolling back fit in naturally, since these are performed after the occurrence of a fault. The same holds for any type of redoing. All these activities are considered particular cases of error correction.

Retrying an operation may be part of an error detection mechanism when used in conjunction with a counting or time-out scheme. It may constitute an error correction when it is used to overcome a transient error. In both cases it is a mechanism used after the occurrence of a fault.

## Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

## G06F 11/1402

# {Saving, restoring, recovering or retrying}

#### **Definition statement**

This place covers:

The techniques covered by  $\underline{\text{G06F }11/1402}$  imply at least an attempt to correct an error. They do not cover the detection as such, which may be found in  $\underline{\text{G06F }11/1497}$  or  $\underline{\text{G06F }11/1479}$ .

## Special rules of classification

Classification of documents relating to snapshots is done as follows:

- documents describing the use or creation of snapshots to deal with the detection or correction of errors are classified in G06F 11/00, and normally in subgroups of G06F 11/1402.
- documents describing other uses of snapshots (or creation of snapshots for such purposes) are
  not classified in G06F 11/00. They are classified in G06F 16/00 or G06F 3/06 unless the specific
  use is provided for in another classification place.
- General-purpose treatment of snapshots (e.g. management of valid snapshots, determining not needed snapshots, storage optimisation, ...) is dealt with in <u>G06F 16/00</u> if the snapshots are on file level. If the snapshots are volume-based snapshots, they are dealt with in <u>G06F 3/00</u> since they concern the management of storage space in this case.

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Persistent data	Data which are still relevant after a normal power off/ power on cycle or a logoff/logon procedure. Typically, the user determines when such data should be modified or destroyed (since they are not relevant anymore). Thus, persistent data is not equivalent to data that is stored in a non-volatile manner, the latter merely giving an indication of the type of memory/storage used to save the data. Non-volatile data does not need to be persistent, but persistent data is always non-volatile.
-----------------	---

# {at machine instruction level}

#### **Definition statement**

This place covers:

Measures taken inside the processor or relating to individual processor instructions. To implement these measures, additional hardware (such as registers) can be used. A necessary condition to classify here, is that the operating system is unaware of the measures taken.

## G06F 11/1415

# {at system level}

#### **Definition statement**

This place covers:

The solution of a specific problem related to the functioning of the computer system(s) as a whole in contrast to a particular application functionality. It is intended to cover firmware level (e.g. BIOS), OS level, file system level and/or utilities.

## Relationships with other classification places

This group is NOT intended to include database specific techniques. Note that if the solutions in these groups involve the use of particular software techniques covered in G06F 11/1479 /low, the documents should be classified there as well. See e.g. the comment under G06F 11/1438 relating to additional classification in G06F 11/1479.

## G06F 11/1417

## {Boot up procedures}

# **Definition statement**

This place covers:

Restricted to correction (attempt) of errors during or using the boot process.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Booting in general	G06F 9/4401
Reboot as part of upgrading to verify the successful upgrade	G06F 11/1433

# {Reconfiguring to eliminate the error (group management mechanisms in a peer-to-peer network H04L 67/1044)}

### **Definition statement**

This place covers:

Reconfiguration meaning that the system undergoes modification of the components that make up the system or their arrangement in response to an error being detected. The components can be either hardware or software components.

#### Example:

• The system switches to a minimal video driver in case the normally used video driver does not give any image anymore.

#### Counterexamples:

- redistributing the load on individual processors of a multiprocessor system in an overload condition
- masking faults by reconfiguring redundant hardware (e.g. making a standby component primary, changing the role of disks in a mirrored pair, ...)

#### References

## G06F 11/1433

# {during software upgrading}

#### **Definition statement**

This place covers:

Potential to recover from errors during or after software update or upgrade or installation processes. Also applies when this process is performed by a specific update/install software or even by the application itself.

## {using file system or storage system metadata}

## **Definition statement**

This place covers:

There is redundancy in the metadata used to access a given stored data item.

#### Examples are:

- File systems having redundant FATs or redundant tuples
- · Redundant CMOS/BIOS data defining the disk layout

## Counterexamples are:

- Retry a read from a disk sector by the disk controller when the read fails. This should be classified G11B 20/00
- Retrying the disk I/O request by the CPU. This should be classified in
- G06F 11/1443.

----------------------------	------------

## G06F 11/1438

## {Restarting or rejuvenating}

# **Definition statement**

This place covers:

The act of restarting a software module (e.g. an application, but not the complete OS, because this would imply a boot process which is covered in G06F 11/1417) either to recover from an error or in order to prevent an error (the latter being rejuvenation). The restarting or rejuvenating may be based on a previous state saving of the software module. Usually, this is based on a previously saved dynamic state of the software module. The dynamic state of a software application or process or task includes at least some of stack, heap, open files, etc. information, from which the application can later continue processing. Continuing from a previously saved state without full application restart is also covered by this group.

# Special rules of classification

If the application restart or rejuvenation mechanism is implemented in an OS or middleware layer outside the application, this aspect is to be additionally classified in G06F 11/1482.

## G06F 11/1441

## {Resetting or repowering}

#### **Definition statement**

This place covers:

Measures taken out of a normal operating mode (after boot) but before abnormal termination of the system to enable a machine to continue processing from a defined state after a re-initialisation (reset

or re-powering) of the machine. Example: power is monitored, when voltage drop is detected, the RAM is saved to disk. After power restore, RAM is reloaded from disk. Or, battery used to temporarily backup the RAM during a (short) power outage.

Without error see G06F 1/3203.

#### References

## Informative references

Detecting errors in the information received	H04L 1/00
Error detection mechanisms part of a communication protocol	H04L 12/00, H04L 69/00

## Special rules of classification

Documents should only be classified here when they concern transmit or communication errors and where the mechanisms used are not part of a communication protocol and no other group of G06F 11/14 and subgroups or G06F 11/16 and subgroups applies.

# G06F 11/1446

## {Point-in-time backing up or restoration of persistent data}

## **Definition statement**

This place covers:

Backup done either on file or data block level. Covers, backing up of any type of file, independent of the data it contains.

Note: Due to considerable overlap in technology, backups and data backup systems frequently are confused with archives and fault-tolerant systems. However:

- Backups differ from archives in the sense that archives are the primary copy of data whereas backups are a secondary copy of data.
- Data backup systems differ from fault-tolerant systems in the sense that data backup systems assume that a fault will cause a data loss event, whereas fault-tolerant systems do not.

The scope of this group also covers ensuring that the data to be saved (as backup copy) is consistent (i.e. represents a meaningful state), especially if the copy is made of data within a distributed system.

File management in general	<u>G06F 16/14</u>

## Special rules of classification

Documents relating to authorisation control or data security of the backups should also be sent to G06F 21/00 for classification

## G06F 11/1451

## {by selection of backup contents}

## **Definition statement**

This place covers:

• any determination of what data should be subjected to backup (e.g. what type of data, which origin of data, according to criticality of the data, ...)

- determining the necessity to include particular data (e.g. based on whether the data has changed)
- in what form the data should be backed up (e.g. incremental backup, full backup, differential backup, ...)

## G06F 11/1453

# {using de-duplication of the data}

## **Definition statement**

This place covers:

all techniques that are used to detect multiple copies of data items (e.g. files, data blocks, strings of data, ...) and to use this knowledge to optimize the backup (e.g. by not retransmitting the detected item, by not storing the detected item twice,...).

This is irrespective of whether the multiple copies are between (backups of) data at different times or between (backups of) different data items having a part in common or between (backups from) different hosts.

# G06F 11/1456

## {Hardware arrangements for backup}

#### Definition statement

This place covers:

subject-matter where the hardware arrangement is affected by its use as backup system or where a particular system arrangement is proposed for backup. However, this does not imply that a particular hardware component must be physically modified for backup purposes

The following are some examples:

- additional (temporary) memory or storage is used to enable efficient writing on the backup medium
- storage which is configured to automatically perform a backup, when connected to a system to be backed up.
- · A specific type of hardware being used for backup

A distributed architecture where some processing nodes are dedicated to particular backup functions

## G06F 11/1458

## {Management of the backup or restore process}

#### **Definition statement**

This place covers:

All operations related to the management of the backup process.

Examples are:

management of backup process:

- how to make the backup process faster
- · avoiding data restoration by unauthorized persons

## Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

Documents relating to authorisation control or data security of the backups should also be sent to G06F 21/00 for classification

## G06F 11/1464

# {for networked environments}

## **Definition statement**

This place covers:

Everything relating to arrangements in which the distributed architecture is of importance for the backup. Examples: Optimizing bandwidth, selecting machines (source or target) for backup, time multiplexed scheduling of backup clients, hierarchical distribution of backup control functionality to different networked machines.

## G06F 11/1466

## {to make the backup process non-disruptive}

#### **Definition statement**

This place covers:

All subject-matter dealing with techniques of limiting the impact of the backup process on normal operations, e.g. by minimizing the backup window.

## G06F 11/1469

## {Backup restoration techniques}

## **Definition statement**

This place covers:

Problems relating to restoring data from a backup using a backup/restore application (in contrast to data movement services of an OS). Examples: Finding and ordering the necessary tapes, handling a target format that is no longer the same as the original one, target system configuration has changed and new locations must be determined, improving restore efficiency.

# Relationships with other classification places

Data migration from one machine to another one	G06F 3/0646, G06F 16/00.

## G06F 11/1471

## {involving logging of persistent data for recovery}

## **Definition statement**

This place covers:

Logging techniques or the usage thereof for the purpose of attempting to recover from errors.

Ensuring that a log contains all necessary data to enable a restore.

Maintenance of the logged data (e.g. pruning obsolete entries to reduce the recovery time).

## References

## Limiting references

This place does not cover:

Journaling used as a data transmission mechanism for asynchronous mirroringCreating a consistent baseline of stored data for recovery to avoid long log processing at restore time is to be classified in other parts of	G06F 11/14, G06F 11/2094.
Journaling for asynchronous mirroring	G06F 11/2074

## Special rules of classification

Documents being classified here that concern transactions in database management systems should be sent to G06F 16/20 for classification as well.

## G06F 11/1479

# {Generic software techniques for error detection or fault masking}

## **Definition statement**

This place covers:

All techniques implemented by software means, i.e. where the fault tolerance does not result from the hardware and is not bound to a particular redundant hardware architecture.

Software architectures and structural approaches independent of the particular problem solved or function that is achieved. As a consequence, documents describing such technique for a particular purpose or hardware architecture as covered by the subgroups of <u>G06F 11/14</u> and <u>G06F 11/16</u> should be classified there as well. As a particular example for this see the comments under <u>G06F 11/1482</u> relating to additional classification in <u>G06F 11/1438</u>.

Documents where the kind of fault tolerance used (active-active, voting, active-passive, ...) is fixed by the hardware architecture and cannot be influenced by the software, should not be classified in this group.

Examples are: Fault-tolerance using data-diversity (e.g. by using different equivalent input data sets for each retry of a function), corrective actions e.g. following a plausibility check. Other examples include measures taken before run time (e.g. duplication of instructions for comparison at compile time) or robust data structures (see XP745785).

Counterexample: the operating system for a Tandem Himalaya system will not be classified here, because it is bound to a hardware architecture that provides the fault tolerance and it does not employ any of the generic techniques covered by G06F 11/1479.

## G06F 11/1482

## {by means of middleware or OS functionality}

## **Definition statement**

This place covers:

There is a software layer (on top of the operating system or integrated in the operating system) which makes applications which are not fault-tolerant run in a fault tolerant way. Typically, this is done by scheduling requests of the application more than once.

A typical example of this is fault tolerant cluster software.

Another example is an OS that detects a faulty process and creates a further copy of the same process on the same processor (but potentially in another memory area).

## Special rules of classification

If the layer implements an application restart or rejuvenation mechanism, this feature is to be additionally classified in G06F 11/1438.

Documents where there is necessarily some hardware redundancy, get an Indexing Code as well in the HW redundancy groups.

Documents which describe said middleware/OS technique in combination with only one redundant hardware architecture always go into the G06F 11/16 and subgroups, but where said technique is

Special rules of classification

explicitly suitable for other redundant hardware architectures, they are classified in <u>G06F 11/1482</u> as well.

The restart related aspect of the second example is to be classified additionally in G06F 11/1438.

Note that <u>G06F 11/1482</u> as such does not imply failover mechanisms, although the underlying hardware becomes redundant because of the software layer. Hence, this hardware redundancy aspect requires classification as well, in this particular case in <u>G06F 11/2023</u> (example docs: US2003018927, US2003105852).

## G06F 11/1487

# **{using N-version programming}**

## **Definition statement**

This place covers:

For error detection the output of multiple versions (typically based on different source codes) of the application code or portions thereof are compared or voted (note that this is different from an acceptance test as defined in <u>G06F 11/1489</u>). This can be in different programming languages, different compilers or implementation of alternative algorithms. The versions may be executed sequentially, concurrently or in parallel on different hardware (thereby making the latter redundant).

# G06F 11/1489

# {through recovery blocks}

#### **Definition statement**

This place covers:

For error detection an acceptance test (mostly a plausibility check or a limit on execution time) is performed on critical code blocks. If the test is not passed, the output of another execution of the same or an alternative version of the block is used for recovery. The executions may be sequential or parallel. Note that an acceptance test is performed using the output of only one of the executions.

## Special rules of classification

If the other execution is systematically performed on the same hardware, this has to be additionally classified in G06F 11/1497.

## G06F 11/1492

## {by run-time replication performed by the application software}

## **Definition statement**

This place covers:

In contrast with <u>G06F 11/1482</u>, here the redundancy is inherent in the application itself. Thus, the application does not rely on any other layer to be fault-tolerant. The redundant portions are necessarily identical, since otherwise the redundancy is not realized at runtime, but is hard coded.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Replication implemented at OS- or middleware level is covered by	G06F 11/1482
N-modular type	G06F 11/1494

Details of time redundant execution on a single processing unit	G06F 11/1497
---	--------------

# {N-modular type}

#### **Definition statement**

This place covers:

Using comparison or voting for the concurrently running replicas of the application software.

# G06F 11/1497

## {Details of time redundant execution on a single processing unit}

## **Definition statement**

This place covers:

A piece of software (module, function, complete application, ...) is always executed two or more times sequentially or concurrently (e.g. as threads) on a single processing unit in order to address transient faults. In particular, this groups covers those aspects relating to the provision of the identical input to all executions of the software. When more than two execution are foreseen this can be used for error correction (not only detection). In particular, this group covers the techniques used to instantiate multiple executions of redundant software, the temporary storage of intermediary results or the duplication of contexts for each instance, as well as the measures taken for the subsequent error detection or fault masking. Note that this group also covers (non-redundant) hardware support for time redundant execution and, thus, cannot be a subgroup of G06F 11/1479.

## G06F 11/16

## Error detection or correction of the data by redundancy in hardware

#### **Definition statement**

This place covers:

• Systems where hardware redundancy is used to detect errors or to correct errors based on the output produced by the redundant components.

## Relationships with other classification places

There are three types of hardware redundancy that can be found here:

The hardware redundancy is used for error detection only: such systems imply that there are at least (and normally only ) two redundant components, which are both active, the output of which is compared (G06F 11/1608, G06F 11/1629). Disagreement indicates an error.

The hardware redundancy is used for error detection and correction: such systems imply that there are at least three redundant components, which are all active, the output of which is voted. In the presence of an error the majority of correct outputs is used to correct the error. Since this is done without reconfiguration of the system, i.e. by ignoring the erroneous component(s), this is called passive fault masking (G06F 11/18).

The hardware redundancy is used for error correction only: such systems imply that there are at least one active component and at least one passive component suited to replace the active one in case the latter is failing. The detection of the failure is not (necessarily) based on hardware redundancy, however the correction of the error is. It requires a reconfiguration of the system as a result of which

Relationships with other classification places

the functionality of the failing component is switched over to a spare (failover, takeover). This is called active fault masking (G06F 11/20).

In this context, voting and comparing are decision processes as to the correctness of the output of the system. This is in contrast to membership determination processes (which may also use majority building), which concern decisions on what the configuration of a system should be.

Testing of redundant computer hardware justifies an Indexing Code in appropriate subgroups of G06F 11/16. Testing of non-redundant but identical computer hardware (e.g. on a wafer) using comparison or voting techniques is G06F 11/22 only. Verifying components against a "golden master" is neither run-time nor fault-masking, this it is not G06F 11/16 but G06F 11/22 or G01R 31/00.

The subgroups fall apart in 2 types:

- "architectural groups", i.e. groups that specify constructional elements (i.e. <u>G06F 11/1608</u> and <u>G06F 11/1629</u>)
- "functional groups", i.e. groups that define a particular functionality that is independent of the architecture (i.e. <u>G06F 11/1666</u> and <u>G06F 11/1675</u>). These groups may be relevant for any type of hardware redundancy or fault masking.

Redundant hardware is a prerequisite to correct permanent (hardware) faults, but is equally successful with transient faults. Thus, <u>G06F 11/18</u> and <u>G06F 11/20</u> provide mechanisms that can successfully deal with both types of faults.

Active fault masking implies a reconfiguration and, thus, a retry in the new configuration for the
operation (or set of operations) that encountered the error. Otherwise there would not be error
correction. Hence, to avoid double classification of (at least) all documents in <u>G06F 11/20</u> there is
the precedence rule under <u>G06F 11/14</u>.

#### Examples:

- Not every (symmetric) multiprocessor is redundant per se, because criteria (A) is not necessarily
  true. However, additional error detection and reconfiguration functionality typically implemented in
  software (OS or application level) could be used to make processors operate redundantly.
- A point-to-point connection that initialises to use as many parallel lanes as possible and automatically reconfigures itself to use less lanes following an error implies redundant communication media, because criteria (A) and (B) are both true.

See definitions in G06F 11/2002 and subgroups regarding redundancy in communications.

## Special rules of classification

In this group the use of the Indexing Codes G06F 2201/00 and lower is mandatory.

Documents dealing with replication are classified in <u>G06F 11/16</u> and subgroups (in particular in <u>G06F 11/2094</u> and (<u>G06F 11/2097</u> or <u>G06F 11/1658</u>) only when the purpose of the replication is for error handling or error detection. If the use is another one (e.g. performance or load balancing) or is not disclosed, the document should be classified in <u>G06F 16/10</u> instead.

Some systems having a set of equivalent/similar hardware resources all used under normal conditions may be reconfigured in response to an error to use only a subset of these resources while still providing the same full logical functionality, however possibly with degraded performance.

In order to decide where such documents are to be classified, the following criteria are used:

- (A) If a reconfiguration mechanism is used following the error detection, we are in the presence of error correction using active fault masking.
- (B) If said mechanism is able to correct permanent hardware faults, this implies the presence of some form of redundancy in hardware.

If both criteria apply, the subject-matter is for G06F 11/20: A AND B => G06F 11/20.

Note in particular that:

Special rules of classification

G06F 11/14 (redundancy in operation) provides mechanisms that can ONLY deal successfully with transient faults.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Redundant hardware	additional hardware for performing the same function as another
	hardware part, provided that in faultless operation you could
	renounce on either hardware parts of the system without loosing
	functionality.

# G06F 11/1604

{where the fault affects the clock signals of a processing unit and the redundancy is at or within the level of clock signal generation hardware}

## **Definition statement**

This place covers:

- Systems with multiple clock generating components with active or passive fault masking, i.e. where the system is continuously clocked even in the presence of failing clock generators.
- Single clock generators that are fault tolerant in themselves, e.g. by comprising multiple oscillators.
- Arrangements that only detect clock faults based on redundancy at or in the clock generating level (typically by comparing signals output by two clock generators).
- The symbols <u>G06F 11/1608</u>, <u>G06F 11/18</u> and <u>G06F 11/20</u> are to be used where appropriate to capture the type of mechanism implementing the clock fault tolerance, if no EC symbol in the respective field is already given.

Note that this group does not require, that the clocked system itself is fault-tolerant.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

designates the common periodic square-waved signal on which synchronous digital components base their operations. This signal does not represent any absolute or relative real, logical or virtual time value (although such time may be derived therefrom by
counting periods of this clock signal).

Computing-related hardware the run-time behaviour of which is not controlled by software (e.g. ALUs, counters, decoders, ...). As soon as the redundant hardware under consideration, the output of which is compared, comprises a software programmable processor ((micro-)controller, CPU, microprocessor, ...), this should go to the G06F 11/1629.

Comparing is understood largely, i.e. it encompasses coherency checks (are the compared results similar enough to be considered the same or equivalent?) not only identity tests.

Processor(s) comparing the input from redundant sources (like buffers) are <u>G06F 11/1608</u> as long as they do not compare their own results. The latter would have to be additionally classified in <u>G06F 11/1629</u>.

## G06F 11/1629

## {Error detection by comparing the output of redundant processing systems}

#### **Definition statement**

This place covers:

This group is intended to contain systems in which the redundant components are programmable (hardware) processors, the runtime behaviour of which is defined by software/firmware.

Comparing is understood largely, i.e. it encompasses coherency checks (are the compared results similar enough to be considered the same or equivalent?), not only identity tests.

## Relationships with other classification places

FPGAs are programmable in respect of their configuration only. In general, the resulting run-time functionality thereof does not constitute a software controllable processor, thus systems comprising redundant FPGAs, the functionality of which is not run-time programmable, should be in **16B**, as long as they form part of computer hardware.

Comparisons of input values are not to be classified here. They may, however, be for  $\underline{G06F\ 11/1608}$  as long as said input is produced by redundant sources. If such a comparison is used to detect errors in the transmission of data, this should be  $\underline{H04L\ 1/00}$ . Redundant sources like sensors may be  $\underline{G05B}$  rather than  $\underline{G06F}$  (see also comments of  $\underline{G06F\ 11/1616}$ ).

# **{using mutual exchange of the output between the redundant processing components}**

### **Definition statement**

This place covers:

This group is intended to comprise systems in which there is no comparator hardware. Instead, all redundant components send their respective output results to each other and each perform the comparison (in software) between their own output and the one(s) received from the other redundant components. This would cover processors exchanging results via a local (processor) bus as well as distributed system which communicate the results via LAN or other type of network.

## Relationships with other classification places

- If there are more than 2 redundant units, this group applies only as far as there is no fault masking (this would be G06F 11/18).
- Redundant hardware comparators distinct from but directly associated with the redundant processing components go into G06F 11/1645.

# G06F 11/1637

# {using additional compare functionality in one or some but not all of the redundant processing components}

#### **Definition statement**

This place covers:

- Consists of systems often denoted as master/checker in which there is no separate comparator
  unit. Instead, one or some of the redundant unit(s) (the checker(s)) do(es) additional work to
  perform the comparison, thereby detecting erroneous behaviour and checking the system for
  correct operation. The additional compare functionality may be implemented in hardware on the
  corresponding processing component(s), or in software executed by the corresponding processing
  component(s).
- Master/checker type architectures in which two processors operate in clock lockstep, where the
  checker compares the values driven by the master with its own corresponding internally present by
  otherwise disabled outputs. If a discrepancy is detected, the checker produces an error signal. See
  the glossary for citations of example master-checker structures. Note that this type of architectures
  also falls in the G06F 11/1654.
- Master/checker architectures where the checker is limited in processing functionality with respect to the master, even though this is not absolutely in line with our definition of hardware redundancy.

#### G06F 11/1641

# **(where the comparison is not performed by the redundant processing components)**

# **Definition statement**

This place covers:

Here one or more hardware units separate from the redundant components are used to compare the results produced by the redundant components. Further details of subgroups

G06F 11/1645 and the comparison itself uses redundant hardware

This covers architectures in which there are comparator units (typically but not necessarily respectively associated with but) distinct from each one of the redundant processing components. The comparators are considered redundant when they perform the same comparison on (copies of) the same signals/data.

# G06F 11/165

# {with continued operation after detection of the error}

#### **Definition statement**

This place covers:

Documents in which an additional mechanism is provided to determine which one(s) of the redundant component(s) shall survive after the detection of the error. This may (but need not) involve a determination of which component is correct, in which case this redundant component can be used to correct the error in the other one(s) such that all redundant processing components can finally continue their operation.

# Relationships with other classification places

However, since they are not based on a majority decision, (otherwise they would be <u>G06F 11/18</u>, see in particular <u>G06F 11/181</u>), the determination of the surviving component(s) is usually not done using redundancy in hardware. Rather, some diagnostics or simple priority rules, possibly based on prior behaviour are used.

## Special rules of classification

Techniques in this group may use active fault masking, passive fault masking (i.e. ignoring the faulty component), or other techniques like retry. If these are described they should get an Indexing Code in the respective field as well.

## G06F 11/1654

{where the output of only one of the redundant processing components can drive the attached hardware, e.g. memory or I/O}

### **Definition statement**

This place covers:

- Here one of the processing components is usually called the "master", the other(s) may be
  denoted as slave(s), checker(s), or shadow(s). The master's: outputs drive the system. The
  slave's: outputs are used for comparison but are otherwise disabled from reaching other
  components of the system.
- Architectures in which both processors have a master and a slave role but for distinct parts of the system, i.e. for different types of output.

## Relationships with other classification places

There may be an overlap of this group with <u>G06F 11/1637</u> when the slave itself also performs the comparison, thereby making it a checker as well.

## Special rules of classification

This group should only be used when there effectively is an asymmetry in the role of the redundant processors. On the contrary, the mere statement that a comparator or bridge or the like selects the outputs of one the processors to drive the attached components does not suffice to justify a different role of the processors.

{Data re-synchronization of a redundant component, or initial sync of replacement, additional or spare unit}

### **Definition statement**

This place covers:

The following types of data transfer activities (possibly using data replication) from a memory, the content of which is assumed to be good, to a one that is not yet current (note that the concerned memories do not need to be themselves redundant):

- sporadic resynchronisation processes used to reintegrate a redundant component into an active/ active system, such process being started in an attempt to correct a fault for instance by rebooting a failing component or by replacing it.
- synchronisation processes occurring at start-up of some redundant active/active systems in which
  the redundant components have to negotiate when they are all ready to enter the lockstep mode of
  operation.
- initialisation processes used to make a redundant component ready to work as a stand-by in active/passive systems.

## Special rules of classification

Documents in this group describing techniques in the context of active/passive systems should additionally have at least one Indexing Code in the G06F 11/20 (see also the comments in G06F 11/2097).

## G06F 11/1662

{the resynchronized component or unit being a persistent storage device (re-synchronization of failed mirror storage G06F 11/2082; rebuild or reconstruction of parity RAID storage G06F 11/1008)}

#### **Definition statement**

This place covers:

- Initialising data of a (newly activated) spare disk, provided this is not a mirror disk (the latter being in G06F 11/2082).
- Typical examples for this are the preparation of file system or database replica.
- G06F 11/1666

## G06F 11/1666

# {where the redundant component is memory or memory area}

## **Definition statement**

This place covers:

- The term memory is meant to comprise solid state devices used as main memory which is directly addressable by the associated CPU, as well as non addressable solid state internal memories (e.g. registers, buffers). It does however not need to be RAM.
- Redundant caches and main memory mirroring (in which case the Indexing Code G06F 11/20 should be given). One of the following Indexing Codes should be used where appropriate to better characterise the fault detection or correction mechanism involved: G06F 11/18, G06F 11/20.
- Error detection (or fault masking) using data replicated in different areas of the same memory device is also covered.

These documents differ significantly from the other mechanisms in <u>G06F 11/1658</u> relating to (main) memory.

## G06F 11/167

# {Error detection by comparing the memory output}

## **Definition statement**

This place covers:

This the appropriate place for comparisons performed on the output of redundant memory (areas).

## G06F 11/1675

# {Temporal synchronisation or re-synchronisation of redundant processing components}

#### **Definition statement**

This place covers:

The 16T groups address the problem of ensuring that corresponding outputs of redundant active components are simultaneously available for error detection or correction at a given time. This does not imply that these outputs are produced simultaneously (see e.g. US2002116662). Such system are frequently said to operate in lockstep (at least at some level of abstraction).

Some active/standby systems using active fault masking, where a standby unit is to be maintained in close time synchrony with its primary, the standby unit thereby effectively maintaining itself current to be ready for failover. Documents of this latter type shall also get at least an Indexing Code in G06F 11/2097.

# G06F 11/1679

## {at clock signal level}

## **Definition statement**

This place covers:

Here systems either use a common clock (clock lockstep) or are otherwise synchronised to such an extend that they produce comparable outputs within the same clock cycle, although not necessarily exactly in phase. If not using a common clock , the synchronisation measures taken affect the clock signal.

## G06F 11/1683

## {at instruction level}

#### **Definition statement**

This place covers:

Here we have documents where the synchronisation occurs at statically predictable places in the code either after each instruction or after each instruction of a predetermined type (e.g. memory write or I/O operation) or by using explicit synchronisation instructions/operations.

# {at event level, e.g. by interrupt or result of polling}

#### **Definition statement**

This place covers:

- Synchronisation mechanisms that are triggered by events asynchronous to the main program. Typical example is synchronisation at the occurrence of an interrupt.
- Also cases in which the events are I/O operations performed in response to a polling mechanism.

## G06F 11/1691

## {using a quantum}

## **Definition statement**

This place covers:

Here the synchronisation process is initiated when a predetermined count (>1) of units of work is achieved.

This could be clock cycles, (selected types of) instructions, interrupts, I/O-operations, elapsed time units or any other suitable countable unit.

## Special rules of classification

In most cases documents should also be classified in one of the other lower subgroups of G06F 11/1675

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Quantum	A predetermined count (>1) of units of work
	• • • • • • • • • • • • • • • • • • • •

## G06F 11/1695

# {which are operating with time diversity}

#### **Definition statement**

This place covers:

Time diversity is the concept to have an active/active system in which one of the redundant components operates with a delay with respect to the other in order to avoid common mode failures that would affect both redundant components in the same way at the same time, thereby not being detectable by comparison. Typically the time delay is a small odd multiple of the half clock period. It has to be taken into account when comparing the outputs in order to compare outputs resulting from the same logical steps, which by definition are not produced simultaneously. (Should time diversity turn out to be a concept useable for active/passive system as well, this group would have to be moved one level up).

using passive fault-masking of the redundant circuits {(error detection by comparing the output of redundant processing systems with continued operation after detection of the error G06F 11/165)}

## **Definition statement**

This place covers:

- Fault masking: hiding the presence of a fault to the user or the environment of a [computer system by means of some sort of redundancy such that the perceived system functionality is not affected.
- Passive fault masking: when a system operates such that no particular action is necessary to mask
  a fault because all necessary operations are constantly performed independently of the presence
  of a fault (e.g. majority voting).

In <u>G06F 11/18</u> this is achieved by redundant active hardware components, the output of which is subjected to a (voting) process which ensures that only output considered correct is propagated in the system. Thereby, those redundant components which are in error are simply ignored, this resulting in a correction of the error(s) through the hardware redundancy.

Passive fault masking means that a system produces correct behaviour/outputs in the presence of faulty components.

Voting is a majority building process, by which the output agreed upon by a majority of the redundant components is selected as the correct one, thereby tolerating any minority number of erroneous outputs.

# Relationships with other classification places

The subgroups fall apart in 2 types:

- "architectural groups", i.e. groups that specify constructional elements (i.e. <u>G06F 11/182</u>, <u>G06F 11/183</u> and <u>G06F 11/184</u>, <u>G06F 11/185</u>)
- "functional groups", i.e. groups that define a particular functionality that is independent of the architecture (G06F 11/181, G06F 11/187, G06F 11/188).

#### References

# Limiting references

This place does not cover:

With continued operation after detection of the error	G06F 11/165
---	-------------

## G06F 11/181

## {Eliminating the failing redundant component}

## **Definition statement**

This place covers:

Documents including an elimination of a faulty component based on the results of a passive fault masking process, through which those components being in the minority are assumed to be the erroneous ones. They can, thus, be eliminated without the need for a separate fault location process. Note that this group implies that the fault masking as such is passive i.e. the correct system output can be produced before the faulty component is eliminated.

# {based on mutual exchange of the output between redundant processing components}

## **Definition statement**

This place covers:

The voting process when it is performed in software by the redundant components themselves, based on their own output and the ones received from the other redundant components. There is no voter hardware.

Processors exchanging results via a local (processor) bus as well as distributed system which communicate the results via LAN or other type of network.

Redundant processing while the other groups at the same level are not.

A system having only a single redundant processing component performing the voting in software is covered as well.

## References

## Limiting references

This place does not cover:

Redundant voters distinct from but directly associated with the redundant	<u>C</u>
processing components go into	

G06F 11/185.

## G06F 11/183

# {by voting, the voting not being performed by the redundant components}

## **Definition statement**

This place covers:

Here one or more hardware units separate from the redundant components are used to vote the results produced by the redundant components.

G06F 11/184 where the redundant components implement processing functionality

Documents where the outputs of redundant processors / CPUs / microcontrollers are voted to perform the passive fault masking.

G06F 11/185 and the voting is itself performed redundantly

Documents where the voting process itself is implemented using redundant hardware, i.e. where the voter does not constitute a single point of failure. The voter does not need to be implemented in hardware, but could be realised as software processes on dedicated voting processors.

Counter-example: each redundant component has a voting module in software, which uses the outputs produced by the other redundant components. This is <u>G06F 11/182</u>.

# {Voting techniques}

## **Definition statement**

This place covers:

Specifics on how the voting process is performed in contrast to remaining G06F 11/18 groups which relate to architectural aspects of the systems.

# Relationships with other classification places

This group is only used for voting for redundant hardware components. See <u>G06F 11/1497</u> and <u>G06F 11/1479</u> and subgroups for voting in the context of redundant software.

# G06F 11/188

# {where exact match is not required}

#### **Definition statement**

This place covers:

Concerns documents where the majority is formed by outputs which are considered equivalent, although not identical. This is frequent in control applications where inputs of the redundant components do not originate from the same source of information. or where they are gained at (slightly) different times. Tolerances or other plausibility or coherence criteria may be used to determine which outputs form the majority.

# G06F 11/20

# using active fault-masking, e.g. by switching out faulty elements or by switching in spare elements

# **Definition statement**

This place covers:

Head-group for all documents in which faults are masked actively, i.e. after the masking is done, the fault is not present anymore in the active part of the system. It is to be noted as well that we are talking exclusively about fault masking and not about error masking.

The subgroups fall apart in 2 types:

- "architectural groups", i.e. groups that specify the constructional element which is redundant (i.e. G06F 11/2002, G06F 11/202 and G06F 11/2053)
- "functional groups", i.e. groups that define a particular functionality that any active fault masking arrangement needs to implement (i.e. <u>G06F 11/2097</u>). This functionality is independent of the particular constructional element which is redundant.

## Special rules of classification

A general concept in the field of active fault masking is that a surviving component takes over the load/work of failing one in addition to its own normal work. For such documents the symbol G06F 2201/85 should be used except for documents getting a dedicated group for this concept (e.g. G06F 11/2035).

In <u>G06F 11/181</u> there are also documents dealing eliminating a faulty component. <u>G06F 11/165</u> possibly uses active fault masking (to ensure the continued operation, some kind of decision is needed to identify one of both components as failed and this one may completely be removed from the system). However, since in those two groups the active fault masking is rather a consequence of the voting or compare, we decided to take this particular subject-matter out of the <u>G06F 11/20</u>.

Special rules of classification

Failover comprises one or more of the following activities:

- error detection: this is not a failover specific mechanism since there is no link between detection
  and failover => such docs to be classified according to the used mechanisms but not necessarily in
  G06F 11/20
- determination of the spare to be used
- · activation of the determined spare
- · declaration of the activated spare as primary
- · elimination of the faulty unit

There is failover taking place as soon as any functionality of a hardware component is taken over by another hardware component, whatever the functionality is.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

hiding the presence of an fault to the user or the environment of a computer system by means of some sort of redundancy such that the perceived system functionality is not affected.
taking particular actions (e.g. reconfiguration, failover) not performed in the error free situation to mask a fault.

# G06F 11/2002

{where interconnections or communication control functionality are redundant (flexible arrangements for bus networks involving redundancy H04L 12/40176)}

## **Definition statement**

This place covers:

All cases where architectural components involved in communication are redundant, as long as no communication protocol layer independent of a particular application is involved.

Examples pertaining to subgroups of G06F 11/2002 are:

- Duplicate connection lines
- Redundant busses (serial or parallel)
- Redundant bus controllers (e.g. PCI)
- · Network interface boards describing built-in redundancy
- A redundant setup of two network adapters which are not redundant in themselves

# Relationships with other classification places

Fault tolerance in communications is for <u>H04L</u> rather than <u>G06F 11/00</u> if the mechanism described is implemented by a communication protocol layer that is independent of a particular application.

Examples that should be classified in H04L:

- fault tolerant FTP protocol.
- client having a session management layer, the layer independently maintaining connections with a server.
- operations relating to establishing or cancelling connections between nodes.
- message replication or retry by a routing algorithm (even fault-tolerant routing);
- dealing with transmission errors occurring on the interconnection media (H04L 1/00)

### References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Flexible arrangements for bus networks involving redundancy	H04L 12/40176
Recovering from network faults	H04L 41/0654
Fault tolerant routing	H04L 45/28

# Special rules of classification

The subgroups <u>G06F 11/2005</u>, <u>G06F 11/2007</u> and <u>G06F 11/2012</u> are to be used together in order to classify 9 different types of redundancy in this field. Regarding details of communication failover no subgroup is foreseen. This has to be searched using the other architectural criteria.

Example: Two PCs connected to a LAN by a respective LAN controller and additionally being connected to each other by a USB cable via respective USB controllers, where the USB connection can be used as alternative path to transmit the same data. This configurations gets all the three subclasses.

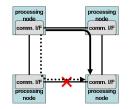

#### Remarks:

- A communication switch implements control logic to realise physical connections between a set of data input ports and a set of data output ports, thus, if not <a href="H04L49/00">H04L49/00</a> this is <a href="G06F11/2005">G06F11/2005</a>.
- Data transfer between processors and memories is not considered communication (rather it is addressing), hence redundant interconnects between processors and memories is <u>G06F 11/2002</u> (not <u>G06F 11/2007</u>).

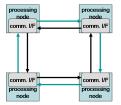

Examples below illustrate how the scheme should work in some typical situations:

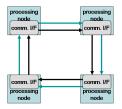

- redundant connections: 11/20C4
- Not <u>between</u> storage system components. (no 11/20C4S)

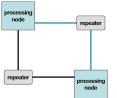

- Not 11/20C2
- Not 11/2002
   Not 11/2004
- No hardware redundancy

 unidirectional links, opposite direction (not same communications), no 11/20C4

 unidirectional links, same direction, redundant if used for same communications: 11/20C4

- Bridge Processing node
- storage controller controller

- redundant communication media 11/20C4
- no redundant communication controllers (no 11/20C2)
- If relevant for G06F (rather than H04L), then redundant communication controllers: 11/20C2
- redundant storage controllers 11/20S4
- No redundant connections: (no 11/20C4)

# {using redundant communication controllers}

# **Definition statement**

This place covers:

Communication controllers are nodes as defined under <u>G06F 11/2007</u> dedicated to performing communication control logic.

# G06F 11/2007

# {using redundant communication media}

# **Definition statement**

This place covers:

Interconnections are physical media and are of point-to-point type or of bus type. Two interconnections are only considered redundant if:

- they both physically connect the same nodes, wherein nodes are any components performing processing or control functionality (examples: computers, bridges, storage controllers, communication switches, counter-example: physical repeater has neither processing nor control logic), and
- are configured to perform the same data transmissions.

Only documents fulfilling these criteria are classified here.

This group covers as well redundant dedicated interconnection media for I/O functionality as long as it does not use general purpose communication interconnection media (like LAN or USB cables).

# G06F 11/201

# {between storage system components}

## **Definition statement**

This place covers:

E.g. multiple IBM channels between controller and disk

{where memory access, memory control or I/O control functionality is redundant (redundant communication control functionality <u>G06F 11/2005</u>; redundant storage control functionality <u>G06F 11/2089</u>)}

## **Definition statement**

This place covers:

All cases where memory access, memory control or I/O control functionality is redundant. An example would be redundant configurations having an active and a passive graphics adapter.

## Special rules of classification

Redundant dedicated interconnection media for such I/O functionality are to be classified in G06F 11/2002 as long as it does not use general purpose communication interconnection media (like LAN or USB cables).

# G06F 11/202

{where processing functionality is redundant (redundant communication control functionality <u>G06F 11/2005</u>, redundant storage control functionality <u>G06F 11/2089</u>)}

#### **Definition statement**

This place covers:

All subject-matter where the redundancy resides in components that perform processing, i.e. components the runtime functionality of which is controlled by software (or firmware), except for ones dedicated to storage control or communication control (see the precedence rule).

For subject-matter to be classified in this group, it is enough that a fault masking is tried when a failure occurs. It is not necessary to have a guarantee that resources will be available to successfully fail over.

## Relationships with other classification places

Two types of subgroups can be identified

- "architectural groups", i.e. groups that specify the actual redundancy arrangement (i.e. G06F 11/2035-G06F 11/2048)
- "functional groups", i.e. groups that define a particular functionality (i.e. <u>G06F 11/2023</u>, G06F 11/2051). This functionality is independent of the particular redundancy arrangement used.

# Special rules of classification

This group has 4 types of subgroups. A class in each of the types should be given (as far as disclosed in the document) systematically. Thus, a document classified in these subgroups will normally have 3 or 4 symbols (invention or additional). The four types are :

- G06F 11/2023 and subgroups
- G06F 11/2035 G06F 11/2041
- G06F 11/2043 G06F 11/2048
- G06F 11/2051

# {Failover techniques}

### **Definition statement**

This place covers:

Details of the failover mechanism

Also includes documents describing failback, i.e. reverting to the original or replacement primary processing unit when it becomes operational again. Currently this also covers documents dealing with the determination/selection of the spare to be used for replacing the failing component. There is failover taking place as soon as any functionality of a processing component is taken over by another processing component, whatever the functionality is.

## G06F 11/2025

# {using centralised failover control functionality}

## **Definition statement**

This place covers:

Where a single component implements the control functionality for failover. This may be a distinct hardware module or software implemented on a single one of the redundant processing components.

# G06F 11/2028

# {eliminating a faulty processor or activating a spare}

# **Definition statement**

This place covers:

Documents describing how to ensure that a failing and formerly active processing component no longer participates in the system functionality. Similarly, documents describing how to activate a former standby processing component to replace the functionality of a failing one. Example: setting bits identifying a node as active in a configuration file.

# Special rules of classification

On the contrary, eliminating a backup unit that is not active (i.e. not within a failover process) is not <u>G06F 11/20</u> since this is not error correction using redundancy in hardware. This is most likely <u>G06F 11/0793</u>.

"Eliminating a faulty processor" needs to be understood broadly. E.g. this includes as well:

- documents describing a complete reconfiguration of the system which results in eliminating not only the faulty processor, but also some functioning components if needed to come to a fault-free system and
- documents dealing with how to determine the fault-free system configuration which eliminates the minimum number of components.

# {using migration}

## **Definition statement**

This place covers:

Transferring runtime context of processes, tasks, jobs, threads etc... from a failing processing component to a replacing one.

# G06F 11/2033

# **{switching over of hardware resources}**

## **Definition statement**

This place covers:

The process of placing resources (other than the redundant processing components) under control of a replacement processing unit instead of a failing one. Example: attaching a RAID or other I/O device to the spare.

# G06F 11/2035

# {without idle spare hardware}

# **Definition statement**

This place covers:

There are no processing components left inactive in failure-free operation.

This group contains all subject-matter where the performance is degraded after a failure has occurred, since the same processing needs to be done on less hardware.

However, performance degradation is not a necessary condition for this group, since a safety margin can be used in the failure-free operation.

# Special rules of classification

"Hot spare" architectures wherein the spares are maintained updated for immediate failover by performing the same processing as the primary (possibly in clock synchronisation with the latter) do not fall in this group, because such spares are considered inactive to the extent they do not perform system functionality beyond what is necessary to function as spare. The same applies to architectures where spares are not completely idle because they monitor the primary to detect whether it is failing. These examples would rather be classified in G06F 11/2038 or G06F 11/2041.

# G06F 11/2038

# {with a single idle spare processing component}

## **Definition statement**

This place covers:

The spare component can be spare for a single one or for a plurality of active processing components. There may be multiple spares which, however, are each a single spare for distinct sets of active processing components.

Also covers the case where the spare component is a hot spare.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Without idle spare hardware

G06F 11/2035

## G06F 11/2041

# **{with more than one idle spare processing component}**

## **Definition statement**

This place covers:

A processing component has more than one spare.

Also covers the case where at least one spare component is a hot spare.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Without idle spare hardware

G06F 11/2035

# G06F 11/2043

# **(where the redundant components share a common memory address space)**

## **Definition statement**

This place covers:

Examples: symmetric multiprocessor; multicomputer with virtual shared memory based on message passing.

# G06F 11/2046

# {where the redundant components share persistent storage (G06F 11/2043 takes precedence)}

# **Definition statement**

This place covers:

Any architecture where redundant components have (at least temporarily) access to common storage independent of whether or not the shared storage is used for or during failover.

#### References

## Limiting references

This place does not cover:

Where the redundant components share a common memory address	G06F 11/2043
space	

{where persistent mass storage functionality or persistent mass storage control functionality is redundant (error detection or correction in information storage based on relative movement between record carrier and transducer G11B 20/18)}

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

· ·	persistent memory subsystems (typically involving disks), the contents of which are not directly physically addressable as data
	words by a CPU

# G06F 11/2056

# {by mirroring}

## **Definition statement**

This place covers:

All subject-matter related to mirroring.

# Relationships with other classification places

Mirroring means that data replication is performed solely by the storage controller(s) or corresponding drivers without the involvement of higher software layers like file systems or databases. However, information provided by such higher layers within the blocks dealt with by the controllers (like sequence numbers or time stamps) may be used within the mirroring operation.

If a higher software layer is involved, this is not considered as mirroring but as backup (if point-in-time) or replication (if continuous) and should be classified in the appropriate places.

Mirroring implies, that the time at which a piece of data is transferred is determined solely by the mirroring functionality (disk controller, disk driver, ...). In contrast, for backup a trigger is necessary from another (typically higher level) software layer.

As a counter-example (i.e. which is not mirroring, but something in G06F 11/1402):

• periodic creation of snapshots and transfer of delta between successive snapshots to update a secondary storage.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Arrangements for replication or mirroring the data, e.g. data	H04L 67/1095
synchronisation between network nodes and/or user terminals	

# {using more than 2 mirrored copies}

## **Definition statement**

This place covers:

Each of the more than 2 copies is a mirrored copy, the original (primary) data itself also being considered as one mirrored copy. An intermediate volume used as a buffer but not representing a full copy (suitable for failover) would not be considered a mirrored copy.

# Special rules of classification

Subject-matter combining mirroring and backup should have double classification.

# G06F 11/2064

# {while ensuring consistency}

#### **Definition statement**

This place covers:

This covers distinct types of consistency problems like write order consistency, consistency between different volumes (broken links problem), consistency groups or writes.

# G06F 11/2066

# {Optimisation of the communication load}

# **Definition statement**

This place covers:

Measures aiming at reducing the amount of data being transferred in the mirror system e.g. from the primary to the mirror site, or between the Host and the primary. Examples: "write coalescing", sending record logs instead of full blocks (journaling).

# G06F 11/2079

# {Bidirectional techniques}

#### **Definition statement**

This place covers:

Systems in which updates occur independently on different mirror copies and are simultaneously propagated to the respective other mirror copies.

## G06F 11/2082

# {Data synchronisation}

## **Definition statement**

This place covers:

This covers resynchronisation of a failed or reconnected mirror as well as initial synchronisation to start mirroring.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

For non-mirroring related disk initialisation

G06F 11/1662

## G06F 11/2089

# {Redundant storage control functionality}

## Relationships with other classification places

Mirroring with multiple controllers does not imply that the controllers are redundant. If one of the storage controllers would be faulty in such a system, either the host will not be able to access the storage anymore or the mirroring functionality will be lost. Thus some storage control functionality will be lost and there is no redundancy on this level.

## G06F 11/2092

# {Techniques of failing over between control units}

## **Definition statement**

This place covers:

This group contains the details about how the faulty storage control element is taken out of operation or how storage control functionality is transferred to other elements.

#### Examples are:

- · changing the system configuration
- shut down of the controller concerned

#### Counter-example:

Eliminating a backup unit that is not active (i.e. not within a failover process) is not <u>G06F 11/20</u> since this is not error correction using redundancy in hardware. This is most likely <u>G06F 11/0793</u>.

# G06F 11/2094

## {Redundant storage or storage space (G06F 11/2056 takes precedence)}

# **Definition statement**

This place covers:

Architectures and problems involving the use of additional storage (space) intended to be used instead of failing storage (space). Typical problems involve eliminating a failing active storage unit or activating spares (possibly storing replicated data).

Also to be used when it is not clear whether an eliminated disk has its data replicated elsewhere.

## Relationships with other classification places

In the case of failing over, this group does not cover the data initialisation of an activated spare, because this is <u>G06F 11/1662</u>.

Note that because of the precedence rule failover in the context of mirroring is not dealt with in this group (see G06F 11/2069).

{maintaining the standby controller/processing unit updated (initialisation or re-synchronisation thereof G06F 11/1658 and subgroups)}

## **Definition statement**

This place covers:

This group contains details of the measures that are taken to keep the data in memory, and/or persistent storage of a spare/stand-by unit (processor or controller) current in order to be ready for take-over. This is a repetitive process (frequently involving data replication) used before the occurrence of the fault.

This group does not contain details of how a component's data is initially made ready to function as backup (this belongs to G06F 11/1658+).

Examples for the use of this group:

- replaying message log on standby node: transmission of log (before failure) is <u>G06F 11/2097</u>, replaying of log is failover (<u>G06F 11/2023</u>) if performed after the failure.
- very hot standby using running standby in lockstep without comparison. The lockstep aspect is to be classified in <u>G06F 11/1675</u> (Indexing Code or EC according to importance). However, since it addresses the problem of maintaining the standby unit updated <u>G06F 11/2097</u> (possibly Indexing Code) should be given.

Example: Two redundant disk controllers control a single disk. Host write requests received by one controller are transferred to the second one (including the data) for temporary buffering until the write is performed by the first one. Should the first one crash, the second one is able to perform incomplete writes. Hence, the second one is maintained updated by the first one for potential failover.

# Special rules of classification

A symbol to indicate the type of redundancy in Hardware (e.g. <u>G06F 11/2038</u>) must be added as additional, when the type of redundancy is not otherwise classified.

## G06F 11/22

# Detection or location of defective computer hardware by testing during standby operation or during idle time, e.g. start-up testing

## **Definition statement**

This place covers:

This group and its subgroups also cover testing at system level, i.e. testing of a combination of hardware and software.

This testing occurs at a time outside of "normal operating mode", e.g. during standby, idle time or at power on.

Next to the testing per se, this group and its subgroups also cover the equipment which is used to test the hardware concerned or to interpret the test results.

## Relationships with other classification places

Subject-matter is classified here if programmable processing logic is part of the device under test. Else, the subject-matter belongs to G01R 31/317.

### References

### Informative references

# Special rules of classification

General rules for G06F 11/22 and subgroups

In <u>G06F 11/22</u> and subgroups, generally only 1 symbol is allocated. The symbol allocated is the most relevant one for the invention information disclosed.

Only if the component being tested and the test itself are important, should the subject-matter be classified in one of the subgroups  $\underline{\text{G06F }11/2205}$  together with another group in  $\underline{\text{G06F }11/22}$ .

Only invention information is classified.

If the software testing part is described and is important, the document should also be sent to G06F 11/36 for classification.

Rules specific to G06F 11/22 per se:

Documents are only classified in  $\underline{\text{G06F }11/22}$  per se if it can not be established whether the test is marginal checking (classified in  $\underline{\text{G06F }11/24}$ ), testing of logical operation (classified in  $\underline{\text{G06F }11/25}$ ) or functional testing (classified in  $\underline{\text{G06F }11/26}$ ).

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Computer hardware	a digital circuit which has programmable processing logic incorporated.
Testing	an execution of the computer hardware which is dedicated to the detection of faults. Thus, the execution of the hardware during the test is not part of the "useful"processing which contributes to achievement of the intended purpose

# G06F 11/2247

# {Verification or detection of system hardware configuration}

# Special rules of classification

Group no longer used for classification. See G06F 11/2289 instead.

# {using fault dictionaries}

## **Definition statement**

This place covers:

Subject-matter where the testing process or test analysis process is guided by a fault dictionary. This is the case when a lookup (based on the test results) is done directly from a list of entries, without any additional processing.

Although 90% of the documents use the fault dictionary to determine where the fault is located or what actions to take; the group also covers subject-matter where information is looked up in the fault dictionary to determine the next test.

## G06F 11/2257

# {using expert systems}

## **Definition statement**

This place covers:

Subject-matter where an error message is correlated with other error messages or parameters.

Although 90% of the documents use expert systems to determine where the fault is located or what actions to take; the group also covers subject-matter where the expert system is used to determine the next test.

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

A computer program that contains a knowledge base and a set of algorithms or rules that infer new facts from knowledge and from
incoming data.

# G06F 11/2263

## {using neural networks}

### **Definition statement**

This place covers:

Although 90% of the documents use the neural network to determine where the fault is located or what actions to take; the group also covers subject-matter where the neural network is used to determine the next test.

## G06F 11/2273

# {Test methods}

## **Definition statement**

This place covers:

Subject-matter where the focus is on how the test is done instead of on what test is done or what is tested.

**Definition statement** 

In general, the documents classified in this subgroup are of a more theoretical nature.

# G06F 11/2284

# {by power-on test, e.g. power-on self test [POST]}

## **Definition statement**

This place covers:

Subject-matter describing what tests are being done on power on. The tests concern the correct functioning of the system as a whole.

# Relationships with other classification places

Documents describing the execution of tests are classified in G06F 11/26 and subgroups.

# G06F 11/2289

# {by configuration test}

G06F 11/263 takes precedence.

## G06F 11/277

with comparison between actual response and known fault-free response

# Special rules of classification

Group no longer used for classification.

by checking the correct order of processing (G06F 11/08 - G06F 11/26 take precedence; monitoring patterns of pulse trains H03K 5/19)

## **Definition statement**

This place covers:

Checking the correct order of processing. the word "order" implies the consideration of a sequence. It can be for example the sequence of instructions in a computer program, the sequence of steps to perform when installing a software on a computer, etc. Typically documents dealing with the verification of a system that is specified in terms of state machine (states and transitions between states) based on reachability analysis can be found in the group. Also documents dealing with the verification that a computer program is executing according to the expected sequence of instructions (i.e. there is no unexpected jump that could be the result of a malicious attack) can be found in the group. This can be done for example by computing a current signature while the program is executing and comparing it to a reference signature.

Monitoring testing in wireless networks	H04W 24/00

# Special rules of classification

The classification process in the <u>G06F 11/30</u> and its subgroups has to be carried out performing the following steps:

- 1. If the document contains interesting aspects about the observation of properties of a running computing system over time in its normal operating conditions without inputting test data, then proceed with ALL of the following steps 2, 3, 4.1, 4.2, 4.3, 4.3.1, 4.4, 4.5 and 5 in sequence, otherwise stop because the document is not to be understood to be about monitoring;
- 2. If the document contains interesting aspects about the (visual or acoustical) display of the monitored data, then classify the document in <a href="G06F-11/32">G06F 11/32</a> and its subgroups;
- 3. If the document contains interesting aspects about the monitoring of computer activity, then classify the document according to the FCRs of G06F 11/34 and subgroups;
- 4.1. If the document contains interesting aspects about monitoring the configuration of the computing system, then classify the document in <a href="G06F-11/3051">G06F 11/3051</a>;
- 4.2. If the document contains interesting aspects about monitoring the status of the computing system, then classify the document in <u>G06F 11/3055</u>;
- 4.3. If the document contains interesting aspects about the monitoring of environmental parameters of the computing system, then classify the document in <a href="G06F-11/3058">G06F 11/3058</a> and subgroups;
- 4.3.1. If power consumption is evaluated through the monitoring of computer activity, then also classify the document in G06F 11/34 and subgroups according to the FCRs of G06F 11/34;
- 4.4. If the document contains interesting aspects about the reporting of the monitored data, then classify the document in G06F 11/3065 and its subgroups;
- 4.5. If the document contains interesting aspects about the sensing of the monitored data, then classify the document in G06F 11/3089 and its subgroups;
- 4.6. If the document has been classified at least once in <u>G06F 11/3051</u>, <u>G06F 11/3055</u>, <u>G06F 11/3058</u>, <u>G06F 11/3065</u>, <u>G06F 11/3089</u> or their subgroups, then classify the document in <u>G06F 11/3003</u> and its subgroups;
- 5. If none of the steps 2-4.6 apply, then classify the document in G06F 11/30.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Computer activity	For this group and its subgroups, computer activity covers the activities performed by the computer system that involve data
	(e.g. processing, data storage, data transfer). It also includes user activity.

Monitoring system	A monitoring system is generally considered to be composed of observing or measuring entities (usually called monitors or observers) and interfaces/probes which link them to the system under observation.
Interfaces/probes	The interfaces/probes sense (or access) data relative to the system under observation and report them to the observing/ measuring entities.
Probe effect	The probe effect is the undesired alteration of a system property caused by the fact that this property is being observed or measured.
Environmental parameters	Environmental parameters of a computing system are: power, currents, temperature, humidity, position, radiation, etc.

{where the computing system component is a storage system, e.g. DASD based or network based (digital input from or digital output to record carriers G06F 3/06; digital recording or reproducing G11B 20/18; for distributed storage of data in networks, e.g. transport arrangements for network file system [NFS], storage area networks [SAN] or network attached storage [NAS], H04L 67/1097)}

## References

#### Limiting references

This place does not cover:

Drivers for digital recording or reproducing units	G06F 3/06
Circuits for error detection or correction within digital recording or reproducing units	G11B 20/18
For distributed storage of data in networks, e.g. transport arrangements for network file system [NFS], storage area networks [SAN] or network attached storage [NAS]	H04L 67/1097

# G06F 11/34

Recording or statistical evaluation of computer activity, e.g. of down time, of input/output operation {; Recording or statistical evaluation of user activity, e.g. usability assessment}

## **Definition statement**

This place covers:

For this group and its subgroups, computer activity covers the activities performed by the computer system that involve data (e.g. processing, data storage, data transfer). It also includes user activity.

This group also includes the modeling of the system or its behaviour, or simulating the execution of the system for observing its properties on a theoretical level.

# Special rules of classification

As criterion to decide whether G06F 11/34 and subgroups applies, it needs to be considered whether computer activity or user activity is being monitored or not.

If the monitoring is done purely to detect when an error occurs,  $\underline{G06F11/0703}$  and subgroups apply instead of  $\underline{G06F11/34}$  and subgroups.

Recording data during software testing or debugging is classified in G06F 11/36 and subgroups.

The subgroups of G06F 11/34 fall apart in 2 blocks :

- G06F 11/3404 G06F 11/3442 and subgroups deal with what is being monitored.
- G06F 11/3447 G06F 11/3466 and subgroups deal with how the monitoring is done.

If both aspects are relevant, classes should be given in both ranges. E.g. performance measurement (G06F 11/3409 or subgroups) where a particular monitoring hardware is used to perform the measurement (G06F 11/3466 or subgroups) is classified in both ranges.

Documents where the monitoring relates to the monitoring of user actions must be systematically classified in <u>G06F 11/3438</u> (as invention or additional information), independent of any other classification.

Following Indexing Codes must be systematically given for documents classified in  $\underline{\text{G06F }11/34}$  and subgroups :

- G06F 2201/80 if the monitoring is specific to databases
- G06F 2201/81 if a threshold influences the monitoring behaviour
- G06F 2201/815 if the monitoring concerns the effects of virtualisation
- G06F 2201/86 for all event-based monitoring
- G06F 2201/865 if software is being monitored
- G06F 2201/87 if the monitored object is a transaction
- G06F 2201/875 if the monitored system includes the internet
- G06F 2201/88 if counts are used
- G06F 2201/885 if the monitored object includes a cache

If the document does not describe what is being monitored, its subject-matter should not be classified in <u>G06F 11/34</u>, but in <u>G06F 11/30</u> or other subgroups of <u>G06F 11/30</u>.

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Monitoring	Extra functionality for observing properties of a running computing
	system over time in its normal operating conditions without
	inputting test data

## G06F 11/3404

# (for parallel or distributed programming)

## **Definition statement**

This place covers:

The subject-matter of this group covers monitoring of parallel or distributed programming. Typical issues addressed are: determining the degree of parallelism, optimizing the degree of parallelism, performance of distribution algorithms.

# {for performance assessment}

## **Definition statement**

This place covers:

monitoring the performance of the computer system or its components.

This group covers not only the monitoring of time, but usage of any (physical or other) resource as well.

This group applies whatever the component (e.g. disk, processor, scheduler,...) of which the performance is being monitored is.

#### References

#### Informative references

Monitoring of user actions	G06F 11/3438

# G06F 11/3433

{for load management (allocation of a server based on load conditions <u>G06F 9/505</u>; load rebalancing <u>G06F 9/5083</u>; redistributing the load in a network by a load balancer H04L 67/1029)}

## **Definition statement**

This place covers:

Only the monitoring activities to determine the load of a computer system or the distribution of the load on the different components of the computer system. However it does not cover any actions that are performed in response to the determined load.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Adapting or redistributing the load in a computer system	G06F 9/00
Adapting or planning the capacity required	G06F 11/3442
Redistributing the load in a network by a load balancer	H04L 67/1029

# Special rules of classification

If time measurement is used to be able to determine the load, documents should be classified as well in G06F 11/3419.

# {monitoring of user actions (tracking the activity of the user H04L 67/535)}

## **Definition statement**

This place covers:

all documents where actions of the user are monitored (e.g. for productivity or allocation of billable employee time).

This includes arrangements to evaluate the usability of a system or component.

## References

## Limiting references

This place does not cover:

Tracking the activity of the user	H04L 67/535

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Usability	Measure of the ease of use of a specific object or set of objects or
	of how easy the object or set of objects is to learn to use

# G06F 11/3442

# {for planning or managing the needed capacity}

## **Definition statement**

This place covers:

This group covers all subject-matter where monitoring is done to come to conclusions about the capacity required. It is necessary that this goal is explicit in the document.

Capacity should be understood here as relating to how much computer resources are needed. In general these are hardware resources (such as the amount of processing power, memory or storage space). However this can also be software resources emulating such hardware (such as an amount of virtual memory, a number of virtual machines, etc.).

In contrast to <u>G06F 11/3433</u>, here the load is taken as a given and the goal is to come to conclusions about the resources that need to be available. The actions taken in response will change the configuration of the system.

# Relationships with other classification places

The actions per se performed to adapt the capacity are not classified here, but rather in G06F 9/00.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Measures to allocate resources	G06F 9/00

# {Performance evaluation by modeling}

## **Definition statement**

This place covers:

This group deals with subject-matter where a model of the system to be monitored (or part of it) is made or modified. This group does not cover the use of the model as monitoring tool (which should be classified according to what is being monitored).

#### E.g. :

- This group covers the construction of a model to determine monitoring points in the system. However, it does not cover a concrete implementation of the monitoring points (which would be in G06F 11/3466).
- This group covers the construction of a model to be used in a simulation. However, the use of the model in a simulation is not covered (this would be in G06F 11/3457).

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

description of a system using mathematical concepts and language. It may help to explain a system and to study the effects
of different components or parameters, and to make predictions about system behaviour

# G06F 11/3452

# {Performance evaluation by statistical analysis}

# **Definition statement**

This place covers:

Performance evaluation by statistical analysis means that statistics are used to come to a conclusion regarding a system parameter. This may be to evaluate system parameters or predict the future behaviour of the system.

It covers as well subject-matter where a relation between different parameter is modelled, based on measured values documenting the relationship (e.g. curve-fitting)

Typically, this would involve multiple executions or the analysis of time series observed.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Stochastic model development of the system for monitoring	G06F 11/3447
---	--------------

# {Performance evaluation by simulation}

## **Definition statement**

This place covers:

Simulation means that execution characteristics of the system or component to be monitored are observed without actually executing the real system or without executing the system or component under real conditions.

## Examples are:

- Monitoring the execution of the real system but with a fictive workload
- Applying a real workload to a model or a mockup of the system

# G06F 11/3466

# {Performance evaluation by tracing or monitoring}

# **Definition statement**

This place covers:

The title of this groups should be read as "by tracing". This group and its subgroups are also relevant if the tracing is not explicitly done to evaluate the performance (for instance if no specific purpose is stated for the tracing).

This group covers arrangements that describe how monitored data of the physical system is being collected or made available. These arrangements can be internal in the system (i.e. tracing) or external to the system (general monitoring arrangements used for monitoring computer activity).

# Relationships with other classification places

Tracing for software testing or debugging purposes is classified in G06F 11/36 and subgroups.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

<u> </u>	Observing or making available monitored data using additional hardware or software functionality in the monitored system or
	component

# G06F 11/3471

# {Address tracing}

# **Definition statement**

This place covers:

Examples are:

- · Observing the addresses circulating on a computer bus
- Monitoring memory accesses for certain address ranges

# {Data logging (G06F 11/14, G06F 11/2205 take precedence)}

## **Definition statement**

This place covers:

The scope of this group is not restricted to logging of monitoring data per se. It covers as well the determination of what monitoring data should be logged and how it should be logged (e.g. condensing the logged data, logging statistics, ...) and analysis of logged monitoring data.

## G06F 11/3485

# {for I/O devices}

# Special rules of classification

Documents describing the monitoring of channels should additionally be classified in G06F 11/349.

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Channel	An independent hardware component that coordinates all I/O to a
	set of controllers or devices

# G06F 11/349

## {for interfaces, buses}

## Special rules of classification

Documents describing the monitoring of channels should additionally be classified in G06F 11/3485.

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Channel	An independent hardware component that coordinates all I/O to a
	set of controllers or devices

# G06F 11/3495

# {for systems}

# **Definition statement**

This place covers:

Applies when communication or interaction between the processing components influences the assessed properties of the whole system.

Thus, it is a necessary condition to have a communication medium involved, however not a sufficient condition. If the system which is observed is limited to the communication medium, it should not be classified here (but in <u>H04L</u> if the medium is a network or in <u>G06F 11/349</u> if the medium is a bus).

#### Examples are:

Monitoring arrangements for distributed systems

**Definition statement** 

- Arrangements for application level response time measurement of web servers
- Monitoring arrangements in a multiprocessor system

# Relationships with other classification places

If the communication protocol or the hardware characteristics of the network are relevant for the monitoring, this should be (additionally) classified in <u>H04L</u>.

## G06F 11/36

# Preventing errors by testing or debugging software

# **Definition statement**

This place covers:

The methods used during software development in order to prevent errors:

- software Analysis (G06F 11/3604 and subgroups), which refers to verifying properties of a program (statically or dynamically)
- software testing (G06F 11/3668 and subgroups), which refers to the activity of detecting errors (using test inputs)
- software debugging (G06F 11/362 and subgroups), which refers to the activity of locating an error.

The class also covers the environments (e.g. GUI, simulators) helping a user to perform software debugging or testing (G06F 11/3664).

# Relationships with other classification places

Tracing for performing performance analysis; G06F 11/3466

Emulators and simulators used for testing computer hardware; G06F 11/261

User interface programs; G06F 9/451

Generating or modifying source code; G06F 8/30

CASE, software engineering tools; G06F 8/30

Compiling; G06F 8/41

Concurrent instruction execution; G06F 9/38

## References

# Limiting references

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Bug	A bug in a program produces an incorrect or unexpected result, or causes the program to behave in unintended ways.
Software analysis	Software Analysis aims at verifying that a program or its specification satisfies certain properties without involving testing (no test inputs are provided to the program under analysis). It can involve for example scanning the source code and analysing the dependencies between the various components, or the use of certain variables, etc. It can consist in the use of formal methods, like model checking or theorem proving which aim at formally guaranteeing certain properties, for example that the program is well-typed, or deadlock free etc. In principle Software analysis does not require the program to execute (static analysis), but in some cases it does, for example to verify runtime properties.
Software testing	Software testing is the process of executing a program, or a discrete program unit, with the intent of finding errors. Tests can only reveal the presence of errors, but cannot ensure the absence of errors. When errors are detected in a program, one might want to start debugging it, i.e. locating precisely the error and correcting it. In both cases (testing and debugging), the program is executed.
Software debugging	Software debugging refers to the activity of locating an error.

# G06F 11/3604

# {Software analysis for verifying properties of programs (byte-code verification G06F 9/44589)}

## **Definition statement**

This place covers:

Software Analysis aims at verifying that a program or its specification satisfies certain properties without involving testing (no test inputs are provided to the program under analysis). It can involve for example scanning the source code and analysing the dependencies between the various components, or the use of certain variables, etc. It can consist in the use of formal methods, like model checking or theorem proving which aim at formally guaranteeing certain properties, for example that the program is well-typed, or deadlock free etc. In principle Software analysis does not require the program to execute (static analysis), but in some cases it does, for example to verify runtime properties.

# G06F 11/3608

{using formal methods, e.g. model checking, abstract interpretation (theorem proving G06N 5/013)}

## **Definition statement**

This place covers:

Mathematically-based techniques (model checking, abstract interpretation, formal proof) for the verification of a program.

# {by runtime analysis (performance monitoring G06F 11/3466)}

## **Definition statement**

This place covers:

Analysing runtime behaviour to detect errors (e.g. performance bug or infinite loops).

## G06F 11/3616

# {using software metrics}

#### **Definition statement**

This place covers:

A software metric is a measure of some property of a piece of software or its specifications, e.g. number of lines in the code, cyclomatic complexity (number of linearly independent paths through a program's source code), or any measure which aims at evaluating the properties of a program.

## References

# Limiting references

This place does not cover:

Software metrics used during software generation	G06F 8/77
--	-----------

# G06F 11/362

# {Software debugging}

# **Definition statement**

This place covers:

Software debugging is the activity of locating and correcting an error.

## References

## Limiting references

Patching of programs	G06F 9/328
r atoming or programs	<u> </u>

# G06F 11/3624

# {by performing operations on the source code, e.g. via a compiler}

## **Definition statement**

This place covers:

Manual or compiler assisted instrumentation or by any automatic tool of the source code according to an instrumentation policy.

# {of optimised code (optimisation G06F 8/443)}

## **Definition statement**

This place covers:

Usually the debugging process is performed on an un-optimised version of a program, and the program is optimised (by the compiler) when fully debugged. However, in some cases one wants to debug the optimised version of a program: for example, some bugs might occur in the optimised version of the code only. An obvious problem that an optimised code will create is when a developer sets a breakpoint in a part of code that has been eliminated by the compiler during optimisation.

## G06F 11/3632

# {of specific synchronisation aspects}

## **Definition statement**

This place covers:

- Methods and arrangements for dealing with the synchronisation issues involved with debugging operations (e.g. when inserting a breakpoint in a multithreaded or distributed program).
- Method and arrangements for investigating synchronisation problems in distributed or multithreaded programs.

## G06F 11/3636

# **{by tracing the execution of the program}**

#### **Definition statement**

This place covers:

Methods and arrangements for generating or analysing traces of a program execution.

## G06F 11/364

# {tracing values on a bus}

## **Definition statement**

This place covers:

Methods and arrangements for gathering or analysing data exchanged on a computer bus (e.g. data bus, memory bus) during the execution of a program.

### G06F 11/3644

# {by instrumenting at runtime}

# **Definition statement**

This place covers:

- Instrumenting operations performed on a compiled program directly before execution (e.g. Valgrind).
- Runtime injection: the code is modified at runtime.

## References

## Limiting references

This place does not cover:

Instrumention of Bytecodes	G06F 11/3624
----------------------------	--------------

## G06F 11/3648

# {using additional hardware}

# **Definition statement**

This place covers:

Hardware arrangements contributing to the debugging process

## G06F 11/3652

# {in-circuit-emulation [ICE] arrangements}

# **Definition statement**

This place covers:

The term "In-Circuit Emulator" in this group only refers to a device replacing the target microprocessor. The code under debug is not executed on the real target processor but rather on a specific hardware that emulates the target processor and that comprises debug facilities for setting breakpoints or watchpoints.

## Special rules of classification

Nowadays, the term "In-Circuit Emulator" refers also to a JTAG or BDM based device which provides access to the internal registers of the target microprocessor. Said device can take control of the target microprocessor, start, stop or resume the code execution. The code under debug is executed on the real target microprocessor, in that case. If the technical contribution of a document refers to such a JTAG/BDM based device, this document should be classified in <a href="G06F-11/3656">G06F-11/3656</a> group (Debug interfaces).

# G06F 11/3656

# {using a specific debug interface}

## **Definition statement**

This place covers:

Aspects related to communication between a host and a target (e.g. JTAG/BDM based "In-Circuit Emulator").

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Joint Test Action Group (JTAG) is the common name for what was later standardized as the IEEE 1149.1 Standard Test Access Port and Boundary-Scan Architecture. JTAG refers nowadays to a bus for transferring debug commands from a host to a target and
debug data from the target to the host.

BDM	Background Debug Mode (BDM) interface is an electronic interface
	that allows debugging of embedded systems. BDM interface allows
	a Host to manage and query a target.

# {using diagnostics (G06F 11/0703 takes precedence)}

## **Definition statement**

This place covers:

The aim of this group is to be able for example, to classify documents which have to do with software bugs, but not at the software development phase, afterwards. For example, if a system crashes during operation, it might be caused by a software bug. The system is diagnosed after the crash (or the failure) to find out where the bug was. This group might have overlap with the **G06F11/07P** and subgroups... e.g. analysis of core dumps, post-mortem debugging, memory leaks, and failure analysis.

## G06F 11/3664

# {Environments for testing or debugging software}

## **Definition statement**

This place covers:

Environment, frameworks, Graphical User Interfaces or simulators that aim at supporting or facilitating the task of a user during the various phases of software testing or software debugging (e.g. to navigate into the code, to or remove breakpoints, to visualize execution traces, to edit/maintain/archive test suites).

The environment may be comparable to a Software Development Environment but it contains features that are specific to the phases of software testing or debugging.

## G06F 11/3668

# {Software testing (software testing in telephone exchanges <u>H04M 3/242</u>, testing of hardware <u>G06F 11/22</u>)}

## **Definition statement**

This place covers:

Software testing is the process of executing a program, or a discrete program unit, with the intent of finding errors.

### References

# Limiting references

This place does not cover:

Attention is drawn to the following places, which may be of interest for search:

Testing of hardware	G06F 11/22
---------------------	------------

## {Test management}

## **Definition statement**

This place covers:

The different activities of software testing:

- test case/script/scenario design (G06F 11/3684)
- test coverage analysis (G06F 11/3676)
- execution of the test cases/scripts/scenarii (G06F 11/3688)
- analysis of the test results (G06F 11/3692)
- maintenance and updates of the test cases/scripts/scenarii in parallel to the software evolution during software development (G06F 11/368)

# Special rules of classification

The document should be classified according to the most relevant information concerning one activity of the software testing.

- if it is possible to identify one relevant piece of information related to one of the identified software testing activities, the document should be in classified in one of the corresponding subgroups: G06F 11/3676, G06F 11/368, G06F 11/3684, G06F 11/3688, G06F 11/3692.
- If it is not possible to extract any relevant information concerning any of the identified software testing activities, the document should be classified in the test management subgroup (G06F 11/3672)

# G06F 11/3676

## {for coverage analysis}

## **Definition statement**

This place covers:

Coverage analysis is concerned with the degree to which test cases exercise or cover the logic of the program. Because testing is a time consuming activity that cannot be exhaustive, the key issue is to apply a subset of all possible test cases which has the highest probability of detecting errors. Coverage analysis is therefore an issue at the design stage (strategy for generating test inputs that are effective in terms of coverage) as well as at the execution stage (how to measure coverage).

Test coverage can refer to different aspects:

- · path coverage
- · data coverage
- line coverage

# G06F 11/368

{for test version control, e.g. updating test cases to a new software version}

#### **Definition statement**

This place covers:

Maintenance and updates of test scripts in parallel to the evolution of the software during software development.

## References

## Limiting references

This place does not cover:

Version control; configuration management for creation of software

G06F 8/71

# {for test design, e.g. generating new test cases}

# **Definition statement**

This place covers:

Generation or updates of test cases, scenarios, scripts. Specific languages for writing tests.

## G06F 11/3688

# {for test execution, e.g. scheduling of test suites}

# **Definition statement**

This place covers:

Scheduling of the tests; recording of test results; regression testing; mutation testing.

## G06F 11/3692

# {for test results analysis}

## **Definition statement**

This place covers:

Comparing the results of the tests with an oracle (assertions, mathematical models, simulations and the like).

# G06F 11/3696

# {Methods or tools to render software testable}

## **Definition statement**

This place covers:

Arrangements for facilitating the testing of a software unit:

- Arrangement can be an interface to provide test inputs.
- Arrangement for simulating missing part of software or hardware that are necessary for performing the execution and the testing of the software unit.
- Arrangement for performing a time compression in order to simulate a long term execution of a software program in a short time frame
- Arrangement for performing the test execution on a different platform

## G06F 12/00

Accessing, addressing or allocating within memory systems or architectures (digital input from, or digital output to record carriers, e.g. to disk storage units, G06F 3/06)

# Special rules of classification

Any classification rules applicable to a specific group also apply to any sub-groups thereof unless overruled by more specific rules.

When one or more sub-group definitions are listed in the definition statement of a group no further description of these sub-groups are provided in this FCR.

The group G06F 12/00 contains no material and should not be used for classification.

Use of Indexing Codes:

All groups have corresponding  $\underline{\text{G06F 12/00}}$  Indexing Code-codes, which should be used for secondary aspects (non-invention information).

Indexing Scheme G06F 2212/00:

In November 2011 a new indexing scheme relating to <u>G06F 12/00</u> has been introduced. The Indexing Codes from the range <u>G06F 2212/20</u>- <u>G06F 2212/7211</u> are mandatory when applicable. The code range <u>G06F 2212/10</u>- <u>G06F 2212/178</u> is not mandatory but should preferably be used for documents characterized by specific technical effects or applications.

Warning: The G06F 2212/00 indexing scheme is new and has not yet been systematically applied to the existing documentation except when explicitly indicated in this document.

# G06F 12/02

Addressing or allocation; Relocation (program address sequencing <u>G06F 9/00</u>; arrangements for selecting an address in a digital store <u>G11C 8/00</u>)

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Compiling techniques to reduce cache misses	G06F 8/4442
Instruction or operand prefetching within processors	G06F 9/38

# Special rules of classification

For prefetching in disk caches this class should be combined with Indexing Code G06F 12/0866.

Indexing Code group G06F 2212/602 is mandatory in this group. The coding of the existing documentation is mostly complete.

#### G06F 12/0864

## using pseudo-associative means, e.g. set-associative or hashing

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Page mode accessing of cache	G06F 12/0882

# Special rules of classification

Indexing Code <u>G06F 2212/6032</u> is mandatory for material dealing with way prediction. The coding of the existing documentation is mostly complete.

#### G06F 12/0866

# for peripheral storage systems, e.g. disk cache

#### **Definition statement**

This place covers:

Dedicated cache memory within storage controller or storage device;

Caching of network attached storage or remote server content;

Disk caching in main memory of host computer, e.g. by operating system.

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Storage adapters, disk storage management	G06F 3/06
Data buffering arrangements for data transfers within storage systems	G06F 3/0656
Caching of dynamically generated data content, e.g. web caching, database query results	G06F 16/00
Temporary data storage in networks	H04L 67/568

# **Special rules of classification**

Indexing Code groups <u>G06F 2212/21</u>, <u>G06F 2212/22</u>, <u>G06F 2212/26</u>, <u>G06F 2212/28</u>, <u>G06F 2212/31</u> and <u>G06F 2212/46</u> are mandatory in this group.

If the invention information can be fully classified in other group(s) it is recommended to add only Indexing Code  $\underline{G06F}$  12/0866.

# G06F 12/0868

# Data transfer between cache memory and other subsystems, e.g. storage devices or host systems

#### **Definition statement**

This place covers:

Data transfer control within the cache system, between the cache and the storage devices or between the cache and the host system.

E.g. concurrent transfers, internal buffering arrangements, pipelining.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Write back control	G06F 12/0804
Replacement control	G06F 12/12

# G06F 12/0871

# Allocation or management of cache space

#### **Definition statement**

This place covers:

Allocation of cache space.

Organisation of cache data, data structures therefore.

Free space management within cache.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Replacement control G06F 12/12

# G06F 12/0873

# Mapping of cache memory to specific storage devices or parts thereof

### **Definition statement**

This place covers:

Selective allocation of (parts of) cache memory space to specific storage devices or parts of such devices.

This group is limited to large granularity mapping of cache areas to portions of a storage system, e.g. allocating cache partitions to individual storage devices.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Set-associative or similar mappings of individual cache entries to storage	G06F 12/0864
device locations.	

# G06F 12/0875

# with dedicated cache, e.g. instruction or stack

#### **Definition statement**

This place covers:

Cache memories adapted for particular applications or specific types of data, e.g. stack caches, instruction caches, caches for graphics information.

### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Drough history cooks, brough toward cooks	COCE 0/20
Branch history cache, branch target cache	G06F 9/38

#### Special rules of classification

Indexing Code group G06F 2212/45 is used in this group.

Warning: Except for G06F 2212/451 these codes have not yet been allocated to the existing documentation.

#### Cache access modes

#### **Definition statement**

This place covers:

Special access modes to cache memory, e.g. burst mode access, partial line accessing.

### G06F 12/0888

# using selective caching, e.g. bypass

#### **Definition statement**

This place covers:

Selective or conditional caching of data, e.g. based on expected usefulness of caching;

Bypassing of cache.

# G06F 12/0891

# using clearing, invalidating or resetting means

#### **Definition statement**

This place covers:

Invalidation of the entire cache memory content or parts of the cache memory content, e.g. upon initialization or task switching;

Hardware techniques for cache memory invalidation.

# References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Main memory updating, e.g. flushing of cache content	G06F 12/0804
Invalidation forming part of a cache coherency protocol	G06F 12/0815
Initialisation circuits for static stores	G11C 7/20, G11C 11/40

# G06F 12/0893

# Caches characterised by their organisation or structure

# **Definition statement**

This place covers:

Cache topology;

Cache structurally integrated within a memory device, e.g. DRAM row cache;

Cache employing DRAM or other technology than SRAM.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Static stores in general	<u>G11C</u>

# Special rules of classification

Indexing Code <u>G06F 2212/305</u> is mandatory for memory with integrated cache memory, e.g. cache DRAM. The coding of the existing documentation is mostly complete.

Indexing Code groups G06F 2212/22 and G06F 2212/27 are used in this group.

# G06F 12/10

## **Address translation**

#### **Definition statement**

This place covers:

Virtual to physical address translation;

Translation fault handling;

Virtual address space management, see provisionally also G06F 12/0284.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Virtual machines.	G06F 9/455
Logical partitioning	G06F 9/50
Address mapping within flash memory	G06F 12/0246
Multi-user or multiprocessor address space allocation	G06F 12/0284
Address mapping or translation in general, not specific to virtual memory	G06F 12/0292

# Special rules of classification

Indexing Codes <u>G06F 2212/65</u>- <u>G06F 2212/657</u> are used in this group. The coding of the existing documentation is mostly complete.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Page	The unit of paging in virtual memory

# using associative or pseudo-associative address translation means, e.g. translation look-aside buffer [TLB]

#### **Definition statement**

This place covers:

Caching of address translations;

TLB miss handling.

# Special rules of classification

Indexing Code group <u>G06F 2212/681</u>-<u>G06F 2212/684</u> is used in this group. The coding of the existing documentation is mostly complete.

Replacement control for TLB's is classified in <u>G06F 12/12-G06F 12/128</u>. An Indexing Code G06F 12/1027 should be allocated in such cases.

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

TLB	Translation Look-aside Buffer
MMU	Memory Management Unit

# G06F 12/1081

# for peripheral access to main memory, e.g. direct memory access [DMA]

#### **Definition statement**

This place covers:

Address translation for peripheral devices, channels, I/O adapters, network adapters, DMA controllers etc.

Memory management units within such devices or interfaces.

# G06F 12/109

# for multiple virtual address spaces, e.g. segmentation (G06F 12/1036 takes precedence)

#### **Definition statement**

This place covers:

Translation for multiple virtual address spaces, e.g. identified by an address space identifier;

Segmentation based on a segment identifier:

Guest address space to host address space translation.

# Special rules of classification

Indexing Codes G06F 2212/656 and G06F 2212/657 are particularly relevant in this group.

# Replacement control

# **Definition statement**

This place covers:

Replacement control in virtual memory, cache memory or TLB.

Replacement algorithms.

# References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Write back control in cache	G06F 12/0804

# **Synonyms and Keywords**

In patent documents, the following abbreviations are often used:

LFU	Least Frequently Used
LRU	Least Recently Used
MRU	Most Recently Used
FIFO	First In First Out

# G06F 12/14

# Protection against unauthorised use of memory {or access to memory}

#### **Definition statement**

This place covers:

Preventing unauthorized access to memory content.

Virtual memory access control.

## References

# Special rules of classification

When a document qualifies for one of the groups below, none of the groups above should be assigned:

Computing Infrastructure, e.g. cluster racks: G06F 15/161

Inter-processor communication: G06F 15/163

Using a common memory e.g. mailbox, dual port memory, UMA, NUMA architectures: G06F 15/167

Using an interconnection network e.g. message passing architectures: G06F 15/173

Direct connection machines e.g. point to point topologies, buses, (partial) crossbars: G06F 15/17337

Being dynamically configurable e.g. loosely coupled nearest neighbour architecture: G06F 15/17343

Indirect interconnection networks (one or several nodes are traversed before reaching destination): G06F 15/17356

Hierarchical e.g. trees, pyramids : G06F 15/17362

Non-hierarchical: G06F 15/17368

On one dimension e.g. linear arrays,rings: G06F 15/17375

On two dimensions e.g. mesh, torus: G06F 15/17381

Topologies not covered by groups <u>G06F 15/17375</u> or <u>G06F 15/17381</u>: <u>G06F 15/17387</u>

Intercommunication techniques specific to parallel machines: G06F 15/17306

Routing: G06F 15/17312

Collective communications e.g. gather/scatter, broadcast, multicast, all to all: G06F 15/17318

Synchronization, hardware support therefore: G06F 15/17325

Distributed shared memory, hardware support therefore e.g. RDMA: G06F 15/17331

Details on network interfaces: G06F 15/1735

Initialisation or configuration control: G06F 15/177

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Processor architectures; Processor configuration forimage data	G06T 1/20
processing	

# Special rules of classification

Comprising a single central processing unit: G06F 15/78

System on Board: computer system on one or more PCB e.g. motherboards, daughterboards, blades: <u>G06F 15/7803</u>

System on Chip: computer system on a single chip: G06F 15/7807

System in Package: computer system on a number of chips in a single package: G06F 15/7807

On-chip cache, off-chip memory: G06F 15/781

Specially adapted for real time processing e.g. comprising hardware timers: G06F 15/7814

Specially adapted for signal processing e.g. Harvard Architectures: G06F 15/7817

Tightly coupled to memory e.g. computational memory, smart memory, processor in memory: G06F 15/7821

Globally asynchronous, locally synchronous e.g. Network on Chip: G06F 15/7825

Reconfigurable architectures: G06F 15/7867

Reconfiguration support e.g. configuration loading, configuration switching (hardware OS): G06F 15/7871

Self reconfiguration: G06F 15/7882

Multiple Contexts: G06F 15/7875

Pipeline reconfiguration: G06F 15/7878

Runtime Interface e.g. data exchange, runtime control: G06F 15/7885

Embedded in CPU as a functional unit: G06F 15/7892

As a coprocessor. G06F 15/7889

Modular architectures e.g. assembled from a number of identical packages: G06F 15/7896

Comprising an array of processing units with common control, e.g. single instruction multiple data processors: <u>G06F 15/80</u>

SIMD multiprocessors: G06F 15/8007

One dimensional arrays e.g. rings, linear arrays, buses: G06F 15/8015

Two dimensional arrays. i.e. mesh, torus: G06F 15/8023

Other topologies.e.g. hypercubes: G06F 15/803

Associative processors: G06F 15/8038

Systolic arrays: G06F 15/8046

Vector Processors: G06F 15/8053

Details on exchanging data with memory: G06F 15/8061

Using a cache: G06F 15/8069

Details on exchanging data with registers: G06F 15/8076

#### **G06F 15/76 (continued)**

Special rules of classification

Special arrangements thereof.e.g. mask, switch: G06F 15/8084

Array of vector units: G06F 15/8092

Data or demand driven: G06F 15/82

Dataflow computers: G06F 15/825

Here are specified the places which could be assigned in addition to the places above to cover further technical details:

Indexing Code G06F 3/0604 finite state machines: controlled by or implementing FSM

# G06F 16/00

# Information retrieval; Database structures therefor; File system structures therefor

#### **Definition statement**

This place covers:

- Systems and methods for retrieving digital information stored in databases, data repositories or file systems, locally or remotely.
- Details of the organisation and preparation of information for use during the retrieving of digital information, e.g. generation of indexing information or query formulation.
- Details of data structures used for information retrieval, such as trees, lists or hashing.
- Details of query processing and the presentation of query results, e.g. in textual or graphical form on graphical user interfaces [GUIs].
- Details of browsing digital information.
- Details of architectures of databases, data repositories or file systems, e.g. physical, logical, virtual, central or distributed architectures.
- Details of managing data stored in databases, data repositories or file systems, e.g. tuning, replication, archiving, synchronisation, concurrency control and interfaces therefor such as GUIs.
- Details of optimising the storage and retrieval of digital information, e.g. de-duplication of stored data, application-specific caching and pre-fetching in file systems, (distributed) databases or web browsers.
- Systems and methods for retrieving data from structured databases and for their management.
   Examples of such structured databases are relational, object-oriented, multidimensional, spatial, temporal and geographical databases.
- Systems and methods for retrieving semi-structured data, e.g. XML formatted data or comma separated values.
- Systems and methods for retrieving text, audio, image, video or multimedia data from databases or for managing document libraries.
- Systems and methods for information retrieval from and browsing in the World Wide Web.

#### Relationships with other classification places

- Content-based information retrieval in databases storing media data, e.g. audio, image or video data, involves the comparison of a search query with a corresponding representation of the data. The generation of the search query and the representation of the data can involve the analysis of the data and the subsequent low-level and high-level feature extraction. G06F 16/00 covers aspects of the actual process of comparison, e.g. similarity matching. The analysis and feature extraction is covered by G06F 18/00, G06T 7/00, G10H and G10L, depending on the type of data.
- Distributed repositories involve the use of networks for data transmission. Specific protocols for information interchange, including on the application layer, are found generally under <a href="H04L">H04L</a>.
- Physical data storage details generally are found in G06F 3/06, G11B or G06F 12/00.

Relationships with other classification places

• The mere use of databases in specific application fields (e.g. administrative or financial processing systems) is covered by the respective application field, e.g. <u>G06Q</u>.

# References

# Application-oriented references

Digital picture intermediate information storage	H04N 1/21
TV guides, electronic programming guides, video distribution, interactive television, VOD (video on demand)	H04N 21/00

# Special rules of classification

- 1. For documents dealing with how a given type of data is retrieved or how the database or repository for this particular type of data is organised, classification should generally take place in the indicated subgroup for the data type as follows:
  - In multimedia databases G06F 16/40
  - Geographical information G06F 16/29
  - Still images G06F 16/50
  - Structured information, records G06F 16/20
  - Unstructured text G06F 16/30

Special rules of classification

- Audio information (e.g. music, speech) G06F 16/60
- Video information G06F 16/70
- Semi-structured information (e.g. XML, CSV) G06F 16/80
- 2. If, however, more than one particular data type is described in some detail, classification under each of the corresponding subgroups should be considered.
- 3. If no specific data type is indicated at all, or an explicit hint is given that the disclosed mechanism can be used for retrieval of arbitrary data types, e.g. a list of alternative data types, then for "generic" data type, use subgroups under G06F 16/90.
- 4. In the case of annotated data/metadata-based retrieval, the type of data used for the retrieval is sometimes different from the data type to be finally retrieved (e.g. associated images are used to retrieve text documents).

In this case, the classification should be decided according to the level of disclosed details concerning each aspect:

- According to the data type retrieved if the use of that metadata of different type is only casually described, and
- According to the data type used for retrieval, e.g. type of the metadata if specific details of this use are disclosed.

In the cases where both aspects are well-covered, double classification can be warranted.

Note: Many problems with generic data types, such as under rule 3, arise for documents describing querying systems/methods using metadata wherein the data type of the data finally retrieved is arbitrary or does not really matter. Using the above approach, these documents simply can be classified under the data type used for the retrieval and in the metadata subgroup under the generic data type subgroup. A similar approach can be applied in case of browsing a data type using a different data type.

- For example: browsing a set of audio files by browsing through the titles of the files or through
  images representing the audio files is to be classified under "browsing of audio data". In case
  some interesting aspects also merit a classification under text, respectively image browsing, this
  should be covered by double classification. Again, classification under "browsing of generic data"
  has to be considered.
- 5. In this technical field, one does not distinguish between invention and additional information in the sense of the IPC Guide § 77-80. Thus, symbols are allocated only as "invention information" (INV) type, irrespective of the true nature of the information: invention or additional.

# G06F 16/10

#### File systems; File servers

## **Definition statement**

This place covers:

Details of file systems and file servers. In particular, this group covers all aspects of generating, accessing and managing files.

# Relationships with other classification places

Relationship of G06F 16/10 with its subgroups:

• For a proper functioning of the file system, management services are used by file system administrators to ensure that the file system provides the expected services; see the definitions below for the subgroup G06F 16/10. A file is an abstract data container used in file systems to manage a set of data. The internal structure of a file normally is not known by the file system, i.e. the file is opaque from the viewpoint of the file system. The internal structure and size of a file

is defined by the application generating and using the file but is independent of the underlying physical storage system used to store the file. Access of user or applications to a file is granted by a file system via its file system interface providing services to create, use and manage files. These user or application oriented services are implemented via file system functionality which is referred to in this group as basic file system functionality; see the definitions below for subgroups G06F 16/13, G06F 16/14 and G06F 16/16.

In addition to this basic file system functionality, many file systems provide further functionalities, e.g. to reduce the consumption of resources, to improve the response time or to adapt the file system to individual user needs; see the definitions below for the subgroup <u>G06F 16/17</u>. File systems are used in many different environments and for different purposes. As a consequence, different file system types have evolved having different capabilities adapted to the specific requirements of the individual use scenarios; see the definitions below for the subgroup <u>G06F 16/17</u>.

- Subgroups <u>G06F 16/13</u>, <u>G06F 16/14</u> and <u>G06F 16/16</u> cover user related aspects of file systems of basic file system functionality, namely file storage and access structures, file search and file and folder operations. These aspects may be found in all types of file systems.
- Subgroup G06F 16/17 covers aspects of further file system functionalities by extending the basic functionality of the file systems e.g. to personalise file systems, to reduce the response time or to minimise required resources such as storage space. These aspects may be found in many types of file systems.
- Subgroup G06F 16/18 covers additional aspects of specific types of file systems. These aspects
  may be found only in one or few types of file systems.

Relationship of G06F 16/10 with G06F 3/0601:

G06F 16/10 covers all aspects related to files where the internal structure and size of a file is independent of the underlying physical storage system used to store the file. This characteristic distinguishes this group from the technical field G06F 3/0601 which covers all aspects of storing and managing data in physical storage systems where the used storage containers, e.g. volumes, LUNs, blocks, sectors, etc., depend on the individual physical storage system. Thus, G06F 3/0601 covers the use of storage oriented or storage dependent data containers, whereas G06F 16/10 covers the use of application oriented and storage independent data containers. In other words, files and directories provide a logical storage organisation on top of a physical storage layout.

Details of block level storage systems	G06F 3/0604
Details of error detection and correction	G06F 11/14
Addressing of a memory level in which the access to the desired data or data block requires associative addressing means, e.g. caches	G06F 12/0802
Protecting data against unauthorised access or modification	G06F 21/00

# Special rules of classification

The classification system of G06F 16/10 is organised in two dimensions. Subgroups G06F 16/11 - G06F 16/17 define different functional aspects of a standard file system. These functional aspects define the first dimension. The subgroup G06F 16/18 defines additional aspects of different file system types. These file system types represent the second dimension. Double classification for functional aspects according to the first dimension and for additional aspects of different file system types according to the second dimension may be considered if a contribution in both dimensions is present.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Data backup	A copy of data created by replicating persistent data from a given storage medium (not from a volatile memory) at a particular point in time for the purpose of potentially later recovering said data in the state it was at said particular point in time. The recovery can either occur through restoration of said replicated data onto a storage medium or memory or by using the memory/medium onto which the copy was created. A backup of data typically is used to at least partially correct or restore lost or corrupted data, although it is accepted that the restored state usually is not identical to the state when the data loss occurred, i.e. some data may be unrecoverable.
File	A file is an abstract data container used in file systems to manage a set of data. The internal structure of a file normally is not known by the file system, i.e. the file is opaque from the viewpoint of the file system. The internal structure and size of a file is defined by the application generating and using the file but is independent of the underlying physical storage system used to store the file.
File system	A file system (or filesystem) is a means to organise data expected to be retained after a program terminates by providing procedures to store, retrieve and update data.
Hierarchical Storage Management (HSM)	A particular case of data migration wherein the target medium is lower in a hierarchical storage system and is used for less frequently used data or for data that is no longer actively used. The target medium is suitable for longer-term storage, is slower and has lower cost per unit of data. In contrast to backup, HSM systems do not provide an additional instance of the data.
Data migration	Moving data from one memory or storage medium to another without effectively replicating it since ultimately only one copy persists. Examples: transferring data from a disk to another one having different reliability, performance or cost properties.
Data replication	The act of creating several instances of the same data of which at least two are available in the absence of errors and modifications of the original data. The different instances may be stored on different locations of a given storage medium or memory or they may be stored on physically distinct media or memories. The concept of replication is independent of the purpose for which it is used, e.g. replication may be used for potential restoration of data, for load balancing and performance improvement, for fault tolerance, or for increasing the availability of data, etc. Data replication can occur at different levels of abstraction, e.g. at database level, at file system level, at the level of disk/storage I/O operations or at the level of (main) memory pages or even individual memory write instructions.

{Details of archiving (lifecycle management in storage systems G06F 3/0649; backup systems G06F 11/1446)}

#### **Definition statement**

This place covers:

Long-term storage or digital preservation of historical data object versions whereas the fact that files are stored in an archive is generally known to the user in contrast to Hierarchical Storage Management (HSM) systems in which the actual storage location is NOT known to the user. Whenever a file has been stored in the archive, the original file in the file system will be deleted, normally to free storage space in the file system.

# {based on file chunks}

#### **Definition statement**

This place covers:

Redundancies in file systems that are eliminated by deduplication based on typically equally sized chunks of a file when the structure of the file is unknown.

# G06F 16/1756

# {based on delta files}

## **Definition statement**

This place covers:

Redundancies in file systems that are eliminated by using delta-files, e.g. for storing multiple versions of files whereas only the modifications between subsequent versions of a file are stored in the delta-file.

## G06F 16/176

## Support for shared access to files; File sharing support

#### **Definition statement**

This place covers:

Techniques for supporting shared access to files, i.e. more than one application is allowed to access the same file.

# {Concurrency control, e.g. optimistic or pessimistic approaches}

#### **Definition statement**

This place covers:

File systems providing support for concurrency control to serialise access to files (pessimistic methods like locking) or provide for conflict resolution methods to resolve file system states where conflicting writes to a file have taken place (optimistic methods).

## G06F 16/1774

# {Locking methods, e.g. locking methods for file systems allowing shared and concurrent access to files}

#### **Definition statement**

This place covers:

Locking methods for file systems allowing shared and concurrent access to files.

## G06F 16/178

# Techniques for file synchronisation in file systems

#### **Definition statement**

This place covers:

- Details of synchronisation in file systems, e.g. synchronisation architectures, conflict resolution, administration of synchronisation by using synchronisation policies.
- Techniques for transparent or automatic synchronisation of files in file systems whereas no user interaction is necessary to perform the synchronisation, e.g. transparently keeping replicated file copies consistent with each other, e.g. by propagation of changes to all file replicas.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

File management policies in general	G06F 16/122
Change detection in file systems	G06F 16/1734

Protocols for data synchronisation between network nodes	H04L 67/1095

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Synchronisation	Synchronisation is a service provided by file systems to
	synchronise two or more independent file systems or to
	synchronise replicas in a distributed file system.

# {Details of non-transparently synchronising file systems}

#### **Definition statement**

This place covers:

The non-transparent synchronisation of files in file systems whereas user interactions are necessary to perform the synchronisation, e.g. user-based file selection, conflict resolution with user support.

## G06F 16/1794

# {Details of file format conversion}

#### **Definition statement**

This place covers:

Details of file format conversion during synchronisation, e.g. synchronisation between heterogeneous file systems.

# G06F 16/18

# File system types

#### **Definition statement**

This place covers:

Details of specific file system types that are specific to the individual file system types, e.g. details of file systems allowing only read-only access to files.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Generic aspects of file systems	G06F 16/13, G06F 16/14,
	G06F 16/16, G06F 16/17

## G06F 16/1805

# {Append-only file systems, e.g. using logs or journals to store data}

## **Definition statement**

- File systems where data is only appended to existing data
- · Append-only file systems using logs to store data

# {providing write once read many [WORM] semantics}

#### **Definition statement**

This place covers:

File system of type WORM (Write Once Read Many), e.g. by using WORM hardware, by using standard hard disk extended by additional functionality implementing the WORM semantic.

## G06F 16/1815

# {Journaling file systems}

#### **Definition statement**

This place covers:

File systems using journals to store files and file metadata.

## G06F 16/182

# Distributed file systems

#### **Definition statement**

This place covers:

Aspects of distributed file systems, e.g. architectures, specific management aspects.

## G06F 16/1824

{implemented using Network-attached Storage [NAS] architecture (distributed or networked storage systems <u>G06F 3/067</u>; protocols for distributed storage of data in a network <u>H04L 67/1097</u>)}

#### **Definition statement**

This place covers:

Systems and methods for storing files in a Network-Attached Storage system (NAS) which provides data access on the file level. The roles of the clients and the file server(s) are distributed over the network.

#### References

#### Limiting references

This place does not cover:

Distributed or networked storage systems which provides data access on the block level	G06F 3/067
Protocols for distributed storage of data in a network	H04L 67/1097

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

NAS	network attached storage
SAN	storage area networks

{Management specifically adapted to NAS (management of storage area networks [SAN] G06F 3/067)}

#### **Definition statement**

This place covers:

Details of management of NAS, e.g. data placement policies of file or file fragments.

## G06F 16/1834

{implemented based on peer-to-peer networks, e.g. gnutella (p2p communication protocols H04L 67/104)}

#### **Definition statement**

This place covers:

File systems storing files in peer-to-peer like storage networks.

#### References

## Limiting references

This place does not cover:

P2P communication protocols	H04L 67/104
-----------------------------	-------------

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

A file system peer implements both the file server and the client role. Thus, a peer may request in its client role a file from another peer. Additionally, the same peer may provide files in its file server
role to other peers. Thus, both the client and the server role are distributed over the network.

# G06F 16/1837

{Management specially adapted to peer-to-peer storage networks (topology management mechanisms of peer-to-peer networks H04L 67/1042)}

## **Definition statement**

This place covers:

Details of file management specifically adapted to peer-to-peer like storage networks, e.g. data placement of file or file fragments.

## References

#### Limiting references

This place does not cover:

	Topology management mechanisms of peer-to-peer networks	H04L 67/1042

## G06F 16/184

# {implemented as replicated file system}

#### **Definition statement**

This place covers:

Details of file systems replicating files on more than one storage place, e.g. a single file or even a complete file system is replicated.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Protocols for supporting replication or mirroring of data between network	H04L 67/1095
nodes	

## Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Replicated file	A replicated file is a copy of an original file and stored in a different storage place as the original file. The replicated file is kept consistent, i.e. synchronised, with the original file.
File replication	File replication is a service provided by the replicated file system whereas the fact that files are replicated is transparent to the users, such as applications, of the replicated file system.

# {Management specifically adapted to replicated file systems}

#### **Definition statement**

This place covers:

Details of management of replicated file systems, e.g. data placement policies of file replicas.

#### G06F 16/1847

# {specifically adapted to static storage, e.g. adapted to flash memory or SSD}

#### **Definition statement**

This place covers:

File systems specifically adapted to or used in flash memory, SSDs, etc. File system data structures or corresponding methods are adapted by taking constraints of the static storage into account.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Dedicated interfaces to non-volatile semiconductor memory arrays	G06F 3/0688

## G06F 16/185

# Hierarchical storage management [HSM] systems, e.g. file migration or policies thereof (details of archiving G06F 16/11)

#### **Definition statement**

This place covers:

Hierarchical storage management (HSM) used in file systems, e.g. lifecycle management, whereas the fact that files are stored on different levels of the HSM system is generally NOT known to the user in contrast to archive systems in which the actual storage location is known to the user. Further, in contrast to backup system only one copy of data objects exists. Whenever a file has been migrated from one level to another level of the HSM system the file copy stored in the previous level of the HSM will be deleted, normally to free storage space in the HSM system.

## References

Backup systems (in backup systems a second, backup copy is created	G06F 11/1446
from the original data without deleting the original data in the primary	
storage)	

## G06F 16/1858

# {Parallel file systems, i.e. file systems supporting multiple processors}

#### **Definition statement**

This place covers:

Details of parallel file systems, e.g. General Parallel File Systems (GPFS).

## G06F 16/1865

## {Transactional file systems}

#### **Definition statement**

This place covers:

File systems supporting transactional operations, e.g. commit processing, logging and recovery of file transactions, on file system objects (e.g. files, directories, etc.).

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Commit processing in structured data stores	G06F 16/2379
	<u> </u>

## G06F 16/1873

# {Versioning file systems, temporal file systems, e.g. file system supporting different historic versions of files}

## **Definition statement**

This place covers:

File system supporting different (historic) versions of e.g. files, directories, etc.

#### G06F 16/188

# Virtual file systems

#### **Definition statement**

This place covers:

Virtual file systems where at least one file system component is virtualised, e.g. transparent access to compressed archives via a virtual file system e.g. DoubleSpace. Another example are virtual file systems implemented by database systems. Thus, file system requests are transparently translated into database queries.

## {Implementing virtual folder structures}

#### **Definition statement**

This place covers:

Virtual file systems with virtual folders or a virtual folder structure.

#### G06F 16/196

{Specific adaptations of the file system to access devices and non-file objects via standard file system access operations, e.g. pseudo file systems (dedicated interfaces to storage systems G06F 3/0601)}

#### **Definition statement**

This place covers:

Details of the file system for accessing devices and non-file objects, e.g. accessing CPU state information, using the standard file system access operations provided by a file system-like interface, e.g. the procfs, sysfs, usbfs, devpts or BSDs kernfs. From an application point of view the devices and non-file objects are accessed as virtual files.

#### References

#### Limiting references

This place does not cover:

Dedicated interfaces to storage systems	G06F 3/0601
---	-------------

## G06F 16/20

## of structured data, e.g. relational data

## **Definition statement**

This place covers:

- Structured data stores comprising all sorts of database management systems based on a particular structured data model such as hierarchical, network (CODASYL), relational, object-relational, object oriented, deductive, and semantic, entity based systems.
- Structured data, in general, means that the data has a certain predetermined structure which is typically the same for a set of managed / stored objects, for example, a set of data records which conform to a certain schema, i.e. the records have a particular number of fields of a certain data type. A schema need not be described explicitly in a document.
- A database system can be implemented on top of a file system, i.e. the records might be simply stored in files. Another indication for structured data could be a sophisticated declarative query / data manipulation language. This criterion should be used when no information about the data type or the storage technology used is available.
- Particular applications of structured data are multidimensional databases that generally are based on specific relational data models.

## Relationships with other classification places

Unstructured data being binary data types such as image or audio data, which have merely a bit string structure (binary objects, files) or text documents including documents with mark-up such as HTML.

Relationships with other classification places

Unstructured data is classified according to the respective data type (audio, image, video, multimedia, web, file systems). For semi-structured data, in particular XML, see <u>G06F 16/80</u>.

# G06F 16/21

# Design, administration or maintenance of databases

#### **Definition statement**

This place covers:

Aspects of defining and managing database models and systems at the logical or external levels, above the physical storage. The group is concerned only with aspects of managing a single database system. Details of tools, functions or services used to support a database administrator including data maintenance activities to support front-end applications.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Data querying (retrieval)	G06F 16/24

## G06F 16/211

# {Schema design and management}

## **Definition statement**

This place covers:

- Systems which support the creation and maintenance of data dictionaries in database systems.
- Details for mappings between schemas, where the mapping solution is independent of the application.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Uses of mappings between schemas in the relevant application group, e.g. object relational mappers and translation layers in client/server interfaces	G06F 16/252
Abstract models in federated databases systems	G06F 16/256
Replication and update of data dictionaries in distributed database systems	G06F 16/27

# {with details for data modelling support}

#### **Definition statement**

This place covers:

Support for users to interactively model data dictionaries or conversions from other data models into the data model supported by the DBMS.

## G06F 16/213

# {with details for schema evolution support}

#### **Definition statement**

This place covers:

Facilities that allow the data dictionary of a database to be changed and support the continued operation of the database applications or of other interfacing systems.

## G06F 16/214

## {Database migration support}

#### **Definition statement**

This place covers:

Facilities to allow a database to be migrated between two different DBMS or between different versions of the same DBMS.

## G06F 16/215

# Improving data quality; Data cleansing, e.g. de-duplication, removing invalid entries or correcting typographical errors

#### **Definition statement**

This place covers:

Facilities that promote improvements to the quality of existing data of a database.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Support for consistency and integrity of data during update operations	G06F 16/2365
--	--------------

# {Database tuning (G06F 16/2282 takes precedence; database performance monitoring G06F 11/3409)}

#### **Definition statement**

This place covers:

Facilities to support the administration of the database operation, i.e. database tuning, not covered by specific storage tuning <u>G06F 16/2282</u>.

#### References

## Limiting references

This place does not cover:

Database performance monitoring	G06F 11/3409
Storage tuning including database reorganisation	G06F 16/2282

## G06F 16/219

{Managing data history or versioning (querying versioned data G06F 16/2474; querying temporal data G06F 16/2477)}

#### **Definition statement**

This place covers:

Support in a database system to keep the history of changes of records.

## References

## Limiting references

This place does not cover:

Querying versioned data	G06F 16/2474
Querying temporal data	G06F 16/2477

Multi-version concurrency control	G06F 16/2336
-----------------------------------	--------------

## G06F 16/22

## Indexing; Data structures therefor; Storage structures

## **Definition statement**

This place covers:

How structured data is stored and maintained at the physical level including indexing in structured data.

An index of a structured database is updated periodically.

# {Column-oriented storage; Management thereof}

#### **Definition statement**

This place covers:

Details to support databases with storage oriented by columns.

#### G06F 16/2219

# {Large Object storage; Management thereof}

#### **Definition statement**

This place covers:

Details of storing and interfacing with Large Objects in databases, e.g. Binary Large OBjects (BLOBs).

## G06F 16/2228

# {Indexing structures}

## **Definition statement**

This place covers:

Creation and/or assembly of index structures.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Indexing structures for textual data

G06F 16/316

## G06F 16/2237

# {Vectors, bitmaps or matrices}

#### **Definition statement**

This place covers:

Bitmap indices and other array oriented indexing structures.

# G06F 16/2246

## {Trees, e.g. B+trees}

## **Definition statement**

This place covers:

• Hierarchical indexes and functions therefor, e.g. merging of new data entries into the hierarchical index

## {Hash tables}

# **Definition statement**

This place covers:

Details of hash table implementations used for indexing in structured databases.

#### G06F 16/2264

## {Multidimensional index structures}

#### **Definition statement**

This place covers:

Any kind of multidimensional indexes for database systems belong in this group. Double classification with the further groups in G06F 16/2228 should be done when needed.

Dimensionality reduction is used for index generation of a multidimensional database.

# G06F 16/2272

# {Management thereof}

#### **Definition statement**

This place covers:

Automatic or manual management of an already existing index comprising only the organisation but not the modification or updating of index entries. This means that normal adjustments of the index as a consequence of an update operation in a database (insert, delete, update) are not classified here, but reorganisations of the index (e.g. as consequence of degradation due to many updates in the database) are classified here.

Facets: The amount of clustering of an index in a relational database is analysed in order to optimise the index.

#### G06F 16/2282

## {Tablespace storage structures; Management thereof}

#### **Definition statement**

This place covers:

Aspects of storing and managing tablespace structures in secondary memory, including partitioning of tables over multiple storage areas, e.g., disks, and reorganisation of databases.

#### G06F 16/2291

#### {User-Defined Types; Storage management thereof}

#### **Definition statement**

This place covers:

Support for user defined types or abstract data types.

# **Updating**

#### **Definition statement**

This place covers:

Updating a database based on update requests to modify database records; the update requests are made by users or front-end applications.

## G06F 16/2308

# {Concurrency control (transaction processing G06F 9/466)}

#### References

#### Limiting references

Concurrency control in file systems	G06F 16/1767
-------------------------------------	--------------

# G06F 16/2315

# {Optimistic concurrency control}

# **Definition statement**

This place covers:

Optimistic approaches for concurrency control, i.e. conflicting accesses are not prevented but resolved later.

## G06F 16/2322

## {using timestamps}

## **Definition statement**

This place covers:

Timestamp based concurrency schemes.

## G06F 16/2329

# {using versioning}

## **Definition statement**

This place covers:

Version based concurrency schemes.

# {Pessimistic concurrency control approaches, e.g. locking or multiple versions without time stamps}

#### **Definition statement**

This place covers:

Pessimistic approaches (avoiding conflicts) for concurrency control, e.g. locking, multiple versions without time stamps, others.

## G06F 16/2343

# {Locking methods, e.g. distributed locking or locking implementation details}

#### **Definition statement**

This place covers:

Locking methods for concurrency control, e.g. multi-granularity/hierarchical/range locking, lock escalation, pre-claiming of locks/consistency levels/predicate locks, distributed locking, locking implementation details, e.g. locking table.

#### G06F 16/235

# {Update request formulation}

## **Definition statement**

This place covers:

Facilitating the definition of requests for updating data.

#### G06F 16/2358

## {Change logging, detection, and notification (replication G06F 16/27)}

#### **Definition statement**

This place covers:

Details of implementing logging of database update operations; detecting changes for the purpose of notifying users or other systems.

#### References

#### Limiting references

This place does not cover:

Use of logging for replication or synchronisation	G06F 16/27
---	------------

# {Ensuring data consistency and integrity}

#### **Definition statement**

This place covers:

Ensuring database consistency and other ACID (Atomicity, Consistency, Isolation, Durability) properties. Use of triggers and stored procedures to support update operations and related impact in the database.

## G06F 16/2372

# {Updates performed during offline database operations}

#### References

Online updates G06F 16/2379

## G06F 16/2379

# {Updates performed during online database operations; commit processing}

#### **Definition statement**

This place covers:

Handling record operations for inserts, edit, deletion, and undo. The operations occur on an individual basis, on batches or in the context of transaction processing.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Aspects of transaction processing regarding CPU programming G06F 9/466

# G06F 16/2386

## {Bulk updating operations (data conversion details G06F 16/258)}

## **Definition statement**

This place covers:

Handling bulk updates during operation of the database, e.g. to minimise impact on the performance for users.

#### References

#### Limiting references

This place does not cover:

Data conversion details	G06F 16/258
-------------------------	-------------

# {Updating materialised views}

#### **Definition statement**

This place covers:

Aspects of ensuring that materialised views, or persistent queries, are kept up to date during update operations.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Query processing	G06F 16/245
Use of materialised views for optimisation	G06F 16/24539

# G06F 16/24

# Querying

## **Definition statement**

This place covers:

Processing retrieval requests, i.e. finding records matching a query.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Using cached query results	G06F 16/24539
Caching (including caching in Client/Server database systems): for database cache management	G06F 16/24552
Plan operators for distributed queries such as join-algorithms adapted to distributed query processing	G06F 16/24553
Processing of distributed queries	G06F 16/2471

## G06F 16/242

# **Query formulation**

## **Definition statement**

- All aspects of query formulation; textual, graphical, explicit or implicit formulation of database queries.
- User interfaces therefor (including help systems therefor).

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Interaction techniques for graphical user interfaces	G06F 3/048
Conversion of a query to an internal format	G06F 16/2452

## G06F 16/2423

# {Interactive query statement specification based on a database schema}

#### **Definition statement**

This place covers:

- Query wizards such as in MS access for constructing queries.
- Query construction based on database schema or entity relationship diagram of database.

Note: Often the user can see the query statement, which allows the user to learn the syntax of the query language.

• ntelligent help systems for the formulation of queries.

Further examples:

- A query assistant that permits the user to enter valid SQL queries; use of dialog boxes.
- Context sensitive help system for formulation of SQL queries; e.g. lists table names.

Attention is drawn to the following places, which may be of interest for search:

Interfaces for the formulation of natural language queries	G06F 16/243

# G06F 16/2425

# {Iterative querying; Query formulation based on the results of a preceding query}

#### **Definition statement**

- All iterative approaches to querying; typically the user interacts with a display of the results of
  a preceding query in order to (re)formulate a new query; for example more restrictive query
  predicates might be formulated to narrow the focus of the query.
- · Feedback on cardinality of qualifying result set.

# {Query predicate definition using graphical user interfaces, including menus and forms (G06F 16/2423 takes precedence)}

#### **Definition statement**

This place covers:

- Graphical user interfaces (typically displaying charts, plots, images, maps, multi-media documents, or cubes etc.) for specifying query predicates for attribute values.
- (Hierarchical) menus and forms used for specifying query predicates for attributes.
- Menu entries that typically are generated by querying database catalog or tables; also use of menus to select predefined queries.
- Query-by-example languages where the user fills example values into a tabular scheme.

------------------------	---------------

## **{Stored procedures}**

#### **Definition statement**

This place covers:

Definition, processing and use of stored procedures.

#### G06F 16/2445

## {Data retrieval commands; View definitions}

#### **Definition statement**

This place covers:

Data retrieval commands and view definitions, e.g. in SQL, the command SELECT (including all features of select statements, unless there are particular classes for them) and VIEWs including view definitions.

## G06F 16/2448

## {for particular applications; for extensibility, e.g. user defined types}

#### **Definition statement**

This place covers:

Query languages designed to support particular applications; commands for extensible query languages for adding user-defined/foreign functions etc.

## G06F 16/245

#### Query processing

# **Definition statement**

This place covers:

Query processing comprises all processing steps that need to be done in order to process a received formulated query: parsing, translation, execution and delivery of the results (or an execution error).

#### G06F 16/2452

#### **Query translation**

## Relationships with other classification places

For Translating queries between clients (applications) and servers (data sources) see <u>G06F 16/23</u> and <u>G06F 16/27</u>; for parsing see <u>G06F 8/427</u>.

## G06F 16/24522

## {Translation of natural language queries to structured queries}

## **Definition statement**

This place covers:

• Translation of the expression in user natural language, e.g. spoken language, of the information to be retrieved, into database queries, e.g. the mapping from natural language (e.g. English) to SQL;

**Definition statement** 

· Question/answering systems;

#### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Natural language analysis, translation, and semantics

G06F 40/20, G06F 40/40

## G06F 16/24524

# {Access plan code generation and invalidation; Reuse of access plans}

# **Definition statement**

This place covers:

- · Generation of code for given access plan;
- Invalidation of access plans when database objects / indexes etc. are dropped.

## G06F 16/24526

## {Internal representations for queries}

#### **Definition statement**

This place covers:

Translations into an internal format such as guery graph models, algebra, parse trees.

## G06F 16/24528

# **{Standardisation; Simplification}**

#### **Definition statement**

This place covers:

Standardisation (conjunctive/disjunctive normal form) and Simplification (general logical transformations like De Morgan etc.).

Note: The standardisation and simplification steps also could be viewed first as simple query optimisation steps, but they have been put under query translation because these steps are often independent of the actual optimiser used; the technical aim is to provide a standardised input format for the query optimiser.

## G06F 16/2453

#### **Query optimisation**

#### **Definition statement**

- · Rewriting and plan optimisation
- · Optimization of application programs by modifying code etc.

## {of parallel queries}

#### **Definition statement**

This place covers:

Optimisation of queries for parallel database systems with respect to best use of parallel execution possibilities;

## Special rules of classification

Double classification could be necessary; for example, when the join order is optimised to enable bushy trees for parallel join processing and additional classification in G06F 16/24544 is needed.

## G06F 16/24534

# {Query rewriting; Transformation}

#### **Definition statement**

This place covers:

- Transformations of the internal representation of the query: transformations (by means of rewriting rules) between different internal representations on a logical level (e.g. query graph model) and transformations from a logical representation to a physical representation having physical plan operators (i.e. hash join or index-nested-loops-join).
- Transforming a (rewritten) logical internal representation into a physical execution plan with concrete plan operators; typically involves selection of plan operators and their execution order based on estimated execution costs.
- Manual rewriting of query statement; includes also logical tests such as for deciding query containment (for query folding etc.); rewriting one query into several queries.

# G06F 16/24535

#### {of sub-queries or views}

## **Definition statement**

This place covers:

View integration and subquery decorrelation.

## G06F 16/24537

#### {of operators}

#### **Definition statement**

This place covers:

Rules for restrictions, joins, group-bys, aggregations, sorting, etc.

# {using cached or materialised query results}

#### **Definition statement**

This place covers:

Query folding where a query is mapped to existing results including partial mapping; special case: reuse of cached results of a particular query.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Maintenance of materialised views (updating, replication)	G06F 16/2393
Database cache management in general	G06F 16/24552

# G06F 16/2454

# {Optimisation of common expressions}

## **Definition statement**

This place covers:

Common subtree recognition and optimisation, also for multi-query optimisation.

Query folding (mapping a query to cached results or materialised views)	G06F 16/24539
---	---------------

# G06F 16/24542

# {Plan optimisation}

#### **Definition statement**

This place covers:

- Enumeration algorithms for plan generation and search strategy;
- Selectivity and cost estimation including learning based techniques for these estimations.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Selectivity estimation or determination for joins	G06F 16/24545
Sampling/generation of statistics	G06F 16/2462

# {Join order optimisation}

#### **Definition statement**

This place covers:

Join enumeration algorithms for determining the join order, e.g. left deep plans vs. bushy plans etc.

#### G06F 16/24545

# {Selectivity estimation or determination}

#### **Definition statement**

This place covers:

- Estimation of the selectivity of query predicates: e.g. estimating the selectivity of the predicate "AGE=40" on a table means estimating which percentage of the records in this table has the value 40 in attribute AGE.
- Other aspects of query cost estimation.

# G06F 16/24547

## {Optimisations to support specific applications; Extensibility of optimisers}

#### **Definition statement**

This place covers:

- · Extensibility;
- Particular query types, etc. optimiser hints;
- Query modifications to implement security control (e.g. by adding predicates to a query according to a security policy in order to mask data).

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Security, Access control	G06F 21/00

## G06F 16/24549

## {Run-time optimisation}

#### **Definition statement**

- Query optimisation at run time of the query.
- Using execution time statistics for re-optimisation.
- · Progress estimation during query execution.

# **Query execution**

#### **Definition statement**

This place covers:

- Actual execution of a single query with a given query execution plan;
- Execution of multiple queries;
- Database hardware, e.g. parallel database machines.

## G06F 16/24552

## {Database cache management}

#### **Definition statement**

This place covers:

- Cache management at the database server itself, at the client/workstation or at the application server.
- · Cache management strategies such as cache granularity management.
- · Semantic cache management.
- · Determining what data to cache.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Query optimisation exploiting the cache

G06F 16/24539

## G06F 16/24553

## {of query operations}

#### **Definition statement**

This place covers:

- Physical operators used to execute operators in a query execution plan; includes particular execution strategies such as returning only the top N rows or delayed delivery of full query results.
- · Non-standard query processing operations.

## G06F 16/24554

## **{Unary operations; Data partitioning operations}**

#### **Definition statement**

- Algorithms for unary operations (which have only one table/data stream as input), such as aggregations/groupings, sorts or scans.
- · Data partitioning operators.
- Hash, random, range, window partitioning, etc.
- · Can also include (partial) replication.

# {Aggregation; Duplicate elimination}

#### **Definition statement**

This place covers:

For example, including algorithms implementing SQL clauses such as having, groupby, cube, rollup, etc.

## References

#### Informative references

## {Efficient disk access during query execution}

#### **Definition statement**

This place covers:

Scan operators, index access.

## G06F 16/24558

## {Binary matching operations}

## **Definition statement**

This place covers:

All operators except joins which have two tables (data streams) as input, such as: universal quantification, division, intersection, union, etc.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Joins <u>G06F 16/2456</u>

## G06F 16/2456

# {Join operations}

## **Definition statement**

This place covers:

Algorithms for joins such as index nested loops join, sort merge join, hash join, etc.

# {Intermediate data storage techniques for performance improvement}

#### **Definition statement**

This place covers:

Compression, bit vectors, surrogate processing, main memory algorithms, etc.

#### G06F 16/24562

## {Pointer or reference processing operations}

#### **Definition statement**

This place covers:

- Pointer-based join operations.
- · Fast pointer dereferencing.
- · Pointer swizzling.

## Special rules of classification

Double classification under G06F 16/289 (OODBMS) should be considered.

## G06F 16/24564

# {Applying rules; Deductive queries}

#### **Definition statement**

This place covers:

- Rules including rule constructs in SQL and active databases;
- Deductive databases in general e.g. datalog; fixpoint semantics; deductive database techniques, in general.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Inference methods or devices G06N 5/04

## G06F 16/24565

# {Triggers; Constraints}

## **Definition statement**

- Trigger and integrity constraints as commonly used in the context of relational or similar database systems; see example in the third version of the Structured Query Language, SQL3.
- Execution models for determining the correct execution order for multiple constraints/triggers that need to be executed.
- Semantical aspects such as relation to statement/transaction atomicity.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Query language aspects

G06F 16/2435

#### G06F 16/24566

## {Recursive queries}

## **Definition statement**

This place covers:

Operators for computing recursive queries, e.g. in the version of the Structured Query Language adhering to the 1999 standard, SQL1999.

## G06F 16/24568

## {Data stream processing; Continuous queries}

#### **Definition statement**

This place covers:

- Query processing for data streams: continuous queries over a data set; the queries are executed continuously over a database, which means that the query must be executed against newly inserted and updated data.
- Event subscription processing where the event filters (= subscription requests or profiles) are seen as continuous queries.

# G06F 16/24569

# {Query processing with adaptation to specific hardware, e.g. adapted for using GPUs or SSDs}

## **Definition statement**

This place covers:

Specific properties of the hardware environment, e.g. GPU, SSDs, on which the query is executed being taken into account.

## G06F 16/2457

# with adaptation to user needs

#### **Definition statement**

This place covers:

Query processing based on:

- · User profiles.
- Weighting of query attributes specifying preferences of users, e.g. for ranking/relevance.
- User context such as location or user's information needs.

Learning aspects for adapting to user needs, e.g. learning user preferences.

# {using data annotations, e.g. user-defined metadata}

#### **Definition statement**

This place covers:

- Query processing using user-defined meta-data / annotations to the data, whereas the user-provided metadata is added to the database.
- Manual classification of data contents for query processing.

## G06F 16/24575

# {using context}

#### **Definition statement**

This place covers:

Using the context of a user or client application as query criteria; context can be diverse, e.g. user's mood or location.

## G06F 16/24578

# {using ranking}

## **Definition statement**

This place covers:

Sorted output of query results in order of relevance; can use weights, etc., to specify relevance. Using this relevance for ranking and cut-off of results after returning the top-N hits.

#### G06F 16/2458

# Special types of queries, e.g. statistical queries, fuzzy queries or distributed queries

# Special rules of classification

Similarity queries for structured data could be classified in this group or for example in <u>G06F 16/24558</u> (binary matching operations, if the document concerns the implementation of the similarity matching); for sorted result output by relevance, see <u>G06F 16/24578</u>.

#### G06F 16/2462

#### {Approximate or statistical queries}

#### **Definition statement**

This place covers:

Approximate query processing which is based on sampling, models or statistical techniques and creates fast, but imprecise answers to queries such as:

- Queries for the generation of statistics about the database, e.g. attribute value distributions.
- · Database sampling.

# {Query processing support for facilitating data mining operations in structured databases}

#### **Definition statement**

This place covers:

Specific support for data mining such as database operators for that purpose or optimisations.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Clustering and classification in relational databases

G06F 16/285

## G06F 16/2468

# {Fuzzy queries}

#### **Definition statement**

This place covers:

Query processing based on fuzzy functions or imprecise query predicates. Text related search predicates (using phonetic searches, etc.) should be further classified in the specific text class for this aspect.

## G06F 16/2471

## {Distributed queries}

## **Definition statement**

This place covers:

- Mapping of queries for distribution transparency.
- Optimizing the execution order of the plan fragments (subqueries) which need to be executed at the various sites.

## G06F 16/2474

# {Sequence data queries, e.g. querying versioned data}

#### **Definition statement**

- Querying sequence data, such as time sequences like, for example, stock price sequences, which typically supports operations such as aggregations or window queries on the sequence data.
- · Implementation techniques such as indexing and optimisation therefor.
- · Querying versioned data.

# References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Processing data streams	G06F 16/24568

# G06F 16/2477

# {Temporal data queries}

## **Definition statement**

This place covers:

Querying

- Specifically adapted to deal with temporal data such as T-SQL or bitemporal models;
- Referring to points in absolute time such as timestamps.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Use of timestamps for internal purposes such as concurrency control	G06F 16/2322
Documents where time or date attributes are treated as ordinary attributes without specific support	G06F 16/24
Time sequences which refer to a relative sequence of points in time	G06F 16/2474

# G06F 16/248

# Presentation of query results

#### **Definition statement**

This place covers:

- Display of the results of a query, e.g. in tabular form, with interface to modify display formats.
- Complex visualisations such as displaying results on a geographical map.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Browsing techniques (e.g. navigating in database)	G06F 16/26
---	------------

# Special rules of classification

Generating/modifying the layout of business reports etc. is not classified in G06F 16/00.

# Integrating or interfacing systems involving database management systems

#### **Definition statement**

This place covers:

Interfaces between systems involving at least a database supporting ad-hoc interaction, systematic integration or some type of co-operation.

## References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Organised distribution or systematic replication of data between	G06F 16/27
databases or database systems	

## G06F 16/252

## {between a Database Management System and a front-end application}

#### **Definition statement**

This place covers:

Solutions specific for the interfaces between clients and a database system.

## G06F 16/254

# {Extract, transform and load [ETL] procedures, e.g. ETL data flows in data warehouses}

## **Definition statement**

This place covers:

Details for implementation of data workflows transferring data from a plurality of databases into a common data store, in particular, the Extract, Transform, Load (ETL) operations to create and maintain data warehouses.

## G06F 16/256

## {in federated or virtual databases}

#### **Definition statement**

This place covers:

Systems providing a data abstraction layer on top of a set of heterogeneous database systems to convey the concept of a single virtual database to the end users or client systems.

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Distributed gueries	G06F 16/2471
Distributed queries	GUOF 10/24/1

# {Data format conversion from or to a database}

#### **Definition statement**

This place covers:

- Specific details of exchanging data between database systems involving a conversion of the data.
- Export and import operations involving some conversion.

## G06F 16/26

# Visual data mining; Browsing structured data

## **Definition statement**

This place covers:

- Visualisation of data sets from a database in order to allow a user to discover interesting data
  properties without formulating an explicit query.
- Using the meta data (schema information) for visualisation of attribute values.
- Browsing a database including navigating between data items.
- Adaptation of the browsing process to the specifics of a database, e.g. displaying database schema information for browsing.

#### Examples:

- Organising large (structured) data sets by grouping to make them conveniently accessible on a small display device.
- Visualising structured data such as: interactions between customers and merchants and interactions associated with a time value, e.g. hits per hour on a web server.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Query formulation aspects	G06F 16/242
Query result display	G06F 16/248

## G06F 16/27

Replication, distribution or synchronisation of data between databases or within a distributed database system; Distributed database system architectures therefor

#### **Definition statement**

This place covers:

Systems that distribute or replicate data between themselves; descriptions of architectures thereof; details in relevant subgroups.

# {Asynchronous replication or reconciliation}

#### **Definition statement**

This place covers:

Implementation details of asynchronous replication and in particular for reconciliation procedures.

#### G06F 16/275

## {Synchronous replication}

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Concurrency control for distributed databases

G06F 16/2308

# G06F 16/278

# {Data partitioning, e.g. horizontal or vertical partitioning}

#### **Definition statement**

This place covers:

Implementation details for data partitioning between databases that fully or partially distributed the data between themselves.

## G06F 16/28

# Databases characterised by their database models, e.g. relational or object models

#### **Definition statement**

This place covers:

Implementation details of specialised database models which are not already covered by subgroups G06F 16/21 - G06F 16/27.

## Special rules of classification

In general, double classification in at least one of the functional subgroups  $\underline{\text{G06F 16/21}}$  -  $\underline{\text{G06F 16/27}}$  and one of the subgroups of  $\underline{\text{G06F 16/28}}$  should be considered.

## G06F 16/282

## {Hierarchical databases, e.g. IMS, LDAP data stores or Lotus Notes}

#### **Definition statement**

This place covers:

Implementation details of supporting the storage and management of hierarchical data.

# {Multi-dimensional databases or data warehouses, e.g. MOLAP or ROLAP}

#### **Definition statement**

This place covers:

Assembly or functionality of multi-dimensional databases or data warehouses [MDDB].

#### Special rules of classification

Double classification with regard to subgroups <u>G06F 16/22</u>, <u>G06F 16/24</u>, and <u>G06F 16/26</u> should be considered.

#### G06F 16/284

## {Relational databases}

#### **Definition statement**

This place covers:

Implementation details specific to relational databases not - covered by any of the subgroups G06F 16/21 - G06F 16/27.

## G06F 16/285

# (Clustering or classification)

#### **Definition statement**

This place covers:

Clustering or classification of structured data. Classes / clusters may already exist or can be created during the classification / clustering process. Documents disclosing class / cluster management of classification or clustering systems also can be found in this group.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

#### G06F 16/287

## {Visualization; Browsing}

#### **Definition statement**

This place covers:

- · Cluster or class visualization or browsing.
- Graphical presentation of clusters or classes as result of a clustering or classification process.
   Additional data can be displayed with the clusters or classes. Typically, when a mouse pointer is brought over them, additional data about the clusters is displayed (interactive cluster display device).

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Visualisation of browsing of textual data	Visualisation or browsing of textual data	G06F 16/358

# {Entity relationship models}

#### **Definition statement**

This place covers:

Implementation details specific to entity-relationship models not covered by any of the subgroups G06F 16/21- G06F 16/27.

## Special rules of classification

In general, double classification in at least one of the functional subgroups  $\underline{\text{G06F 16/21}}$ -  $\underline{\text{G06F 16/27}}$  and subgroup  $\underline{\text{G06F 16/288}}$  should be considered.

#### G06F 16/289

## {Object oriented databases}

## **Definition statement**

This place covers:

- Implementation details specific to object-oriented databases not covered by any of the subgroups G06F 16/21- G06F 16/27.
- · Hybrid Object-Relational database models.

## Special rules of classification

In general, double classification in at least one of the functional subgroups  $\underline{\text{G06F 16/21}}$  -  $\underline{\text{G06F 16/27}}$  and subgroup  $\underline{\text{G06F 16/289}}$  should be considered.

## G06F 16/29

## Geographical information databases

#### **Definition statement**

This place covers:

Data structures and retrieval of geographical or spatial information, e.g. digital maps.

# of unstructured textual data (document management systems G06F 16/93)

#### **Definition statement**

This place covers:

Retrieval of unstructured or raw text data in databases and/or employing metadata of the text type for retrieving other information, possibly of a different type.

#### References

#### Limiting references

This place does not cover:

Document management systems	G06F 16/93

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Image retrieval using shape and object relationship, including layout-based retrieval of text documents	G06F 16/5854
Retrieval from the World Wide Web, e.g. using search engines	G06F 16/95
Text processing, parsing and translation of natural language	G06F 40/40 - G06F 40/58

# G06F 16/31

# Indexing; Data structures therefor; Storage structures

#### **Definition statement**

This place covers:

- Details about the creation or structure of an index.
- · Updating or maintenance of indexes.

#### G06F 16/313

## {Selection or weighting of terms for indexing}

#### **Definition statement**

This place covers:

- Extraction of strings from a text for indexing purposes.
- Identification or extraction of important information (special words, regions, relations between words in the text, etc.) from text content using mathematical calculations or dictionaries. The weight value indicating the importance of the information may be attached to it.

#### Facets:

- Automatically extracting information for annotating a document;
- A text is stemmed, stop words are removed and the remaining words are weighted according to their frequency of occurrence;

**Definition statement** 

- Segmentation and topic identification of texts. Weight values may be used to express semantics;
- Extracting relevant information for indexing from natural language texts by parsing the text into components and extracting elements of information from the respective components;
- Transforming unstructured text into structured data (using criterion-value pairs, e.g. model, year, colour as criterions for text relating to automobiles); expansion of indexing terms, e.g. with synonyms or spelling variants.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Extraction or weighting of terms for query translation	G06F 16/3334
Extraction or weighting of terms for text summarization	G06F 16/345

## G06F 16/316

## {Indexing structures}

#### **Definition statement**

This place covers:

Creation or structuring of a physical index storing the information to be indexed together with a physical location.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Indexing structures for structured data	G06F 16/2228
---	--------------

# G06F 16/319

## {Inverted lists}

## Special rules of classification

Inverted lists often are used to index terms in a database. When these terms consist of text, these documents should be classified here and not in the G06F 16/22 (Database / building index) groups.

#### G06F 16/322

# {Trees}

#### **Definition statement**

This place covers:

Documents disclosing hierarchical indexes.

Facets: Character strings in a text are stored hierarchically as keywords in an index file.

# {Hash tables}

#### **Definition statement**

This place covers:

Implementation details of hash tables used for indexing textual documents.

#### G06F 16/328

# {Management therefor}

#### **Definition statement**

This place covers:

Documents focussing on the automatic or manual management of an already existing index. This only comprises the organisation and not the modification or updating of index entries.

#### Facets:

- · Compression of a text index
- · Using a GUI to manage an index

# G06F 16/3322

# {using system suggestions (G06F 16/3325 takes precedence)}

## **Definition statement**

This place covers:

- Query formulation based on system suggestions, e.g. by using keywords, categories, etc. The user can decide whether to make use of these suggestions or not.
- Using (parts of) previous queries as suggestions for new queries.
- Using pre-stored categories for making system suggestions.

#### References

# Limiting references

This place does not cover:

Query reformulation based on results of preceding query	G06F 16/3325

#### Informative references

Dialogues to establish an executable query	G06F 16/3329
Automatic query expansion with no user interaction	G06F 16/3338
Reuse of stored results of previous queries	G06F 16/3349

**(using document space presentation or visualization, e.g. category, hierarchy or range presentation and selection)** 

#### **Definition statement**

This place covers:

Interactive interfaces for formulating queries using a category hierarchy.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

(Categorized) browsing without generating a query

G06F 16/34

## G06F 16/3326

{using relevance feedback from the user, e.g. relevance feedback on documents, documents sets, document terms or passages}

#### **Definition statement**

This place covers:

The user informing the system about the relevance (or non-relevance) of (some of) the results. This relevance information is used in reformulating the query.

#### Facets:

- Explicit feedback by the user.
- Evaluating implicit feedback, e.g. click through data.
- Pseudo-feedback (where no real relevance feedback from the user is received but the top-ranking documents are considered as being highly relevant).

## G06F 16/3328

## **{using graphical result space presentation or visualisation}**

#### **Definition statement**

This place covers:

Iterative refinement or modification of the query formulation based on a graphical display of the results.

Facets: Limiting the next query to certain documents by graphically selecting these documents in the result set (e.g. using a rectangle or lasso tool).

#### Example:

Text content: Making a standard keyword query and presenting the results in a 2D map by building feature vectors, mapping each information item to a point in the 2D map based on similarity. Choosing a query area in the 2D map, displaying the items belonging to the query area

# {Natural language query formulation or dialogue systems}

#### **Definition statement**

This place covers:

- A dialogue between the system and the user to establish an executable query.
- Also natural language question-answering systems wherein prefabricated answers are retrieved.

# Relationships with other classification places

Q&A systems constructing an answer by mining knowledge from e.g. a text corpus are covered by G06N 5/00.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Character input using prediction techniques	G06F 3/0237
Suggesting modifications to executable queries	G06F 16/3325

## G06F 16/3331

# {Query processing}

#### **Definition statement**

This place covers:

General aspects of processing queries.

## G06F 16/3332

# **{Query translation}**

#### **Definition statement**

This place covers:

Pre-processing the query to make it (more) suitable for query execution; it is typically done internally with no user interaction.

#### References

#### Informative references

Modification of queries with user interaction	G06F 16/332
---	-------------

# {Selection or weighting of terms from queries, including natural language queries}

#### **Definition statement**

This place covers:

Identifying or extracting important information (for the purpose of querying) from an input (query) text or a query.

#### Facets:

- Identifying keywords in a text (e.g. an SMS), a query is generated therefrom for retrieving a set of images illustrating the text.
- Identifying (spoken) keywords in a phone conversation used for querying a knowledge base.
- A user inputs a plurality of search terms, e.g. by copy and paste from a text. The system extracts the search terms that occur infrequently in the set of documents.

Feature extraction for indexing purposes	G06F 16/313
--	-------------

# G06F 16/3335

# {Syntactic pre-processing, e.g. stopword elimination, stemming}

#### **Definition statement**

This place covers:

Basic pre-processing steps like eliminating words useless for purposes of retrieval (stop word elimination) and reducing variants of the same root word to a common stem (stemming).

#### References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Lexical analysis	G06F 8/425

## G06F 16/3337

# {Translation of the query language, e.g. Chinese to English}

#### **Definition statement**

This place covers:

- Translating queries in the native language of the user (e.g. Chinese) to the query language of the respective search engine (e.g. English).
- Translating English queries into Spanish equivalent for querying a Spanish index.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Language translation G06F 40/40

#### G06F 16/3338

## {Query expansion}

#### **Definition statement**

This place covers:

Automatically adding query terms to a given query/automatically reformulating the query.

#### Facets:

- Query expansion/reformulation based on semantic information stored in thesauri and/or ontologies; use of synonyms/hypernyms/hyponyms for query expansion/reformulation.
- · Concept-based querying of a document database.
- · Expanding a query using different spelling variants of query terms.
- A set of text documents is queried not only using the most recent user query but also using keywords extracted from the queries received since the last switch of query topic was detected.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Query expansion by the user based on system suggestions <u>G06F 16/3322</u>

## G06F 16/334

## {Query execution (G06F 16/335 takes precedence)}

# **Definition statement**

This place covers:

Methods used to calculate the degree of similarity between two entities (typically documents) or an entity and a query. These methods normally are used to rank query results. In the parent group, documents are kept which do not focus on how the calculation is done.

Facets:

Degree-of-similarity score is somehow calculated and reorganized into heap form to select highest score.

#### References

#### Limiting references

This place does not cover:

Query execution based on matching of textual data against a user profile G06F 16/335

# {using boolean model}

#### **Definition statement**

This place covers:

Similarity calculated or estimated with boolean or extended boolean models.

#### G06F 16/3343

# {using phonetics}

#### **Definition statement**

This place covers:

Matching phoneme lattices of a query with phonemes of information annotated to the information to be retrieved.

## G06F 16/3344

# {using natural language analysis}

#### **Definition statement**

This place covers:

Similarity that is estimated based on the semantic meaning of the query and the semantic meaning of every sentence in a document collection. For this purpose, the relation and associated sense of different parts of sentences (sub sentences, words or suffixes) to each other are analyzed.

In some documents, the term "natural language query" that is often used for queries which are not really natural language based but a simple enumeration of query words connected by a logical AND (e.g. Google queries).

Facets:

Similarity that is calculated by creating and using a graph for every sentence where words are nodes and the relationship of the words is represented as links between the nodes.

# Relationships with other classification places

Q&A systems constructing an answer by mining knowledge from a text corpus: G06N 5/00

#### References

Q&A systems matching natural language queries to prefabricated	G06F 16/3329
answers	

# {using probabilistic model}

#### **Definition statement**

# This place covers:

Ranking that is done on the probability that a retrieved document really comprises what the user is looking for. The sum of the probability that the document is important and the probability that the document is not important has to be one.

#### Facets:

Two content vectors are given; the probability that the first content vector is relevant to the second content vector is estimated using distributions of words.

# G06F 16/3347

# {using vector based model}

#### **Definition statement**

This place covers:

Documents that are represented as content vectors in a vector space. Relevance of a query result is calculated by operations done in vector space.

#### Facets:

- Feature vector of a document is created comprising content vector, size of the font, date of publication and name of author.
- Document vectors that are formed from word vectors and compared to a query vector.

# Relationships with other classification places

Feature vectors representing web pages including content vectors of the page should be double classified here and in the corresponding web group in G06F 16/95.

# G06F 16/3349

## {Reuse of stored results of previous queries}

This place does not cover:

Filtering based on user profile in web context	G06F 16/9535,
	<u>G06F 16/9536</u>

## G06F 16/337

# {Profile generation, learning or modification}

## **Definition statement**

This place covers:

Generation of the user profiles, either automatically or manually, and/or learning of the user preferences.

Facets: Different user profiles are analysed and compared to expand the profile of an individual user.

#### G06F 16/338

# Presentation of query results

#### **Definition statement**

This place covers:

- Highlighting of search terms in the result set of a query.
- Visualizing the relevance of the query results showing the respective contribution of the individual query terms.

# References

#### Informative references

Presentation or visualization of query results integrated with query reformulation	G06F 16/3328
Browsing or Visualization without relation to a query, e.g. simply visualizing a document or document space	G06F 16/34
Clustered display of query results	G06F 16/358

# **Browsing; Visualisation therefor**

#### **Definition statement**

#### This place covers:

Mechanisms using non-textual data (e.g. graphical data) for the visualization of collections of text documents, single text documents and concepts of text documents. These mechanisms can be used for document browsing.

#### Facets:

- Highlighting important sentences in a text document.
- Creating a table of contents of a text document that can be used for browsing (eBook).
- A calendar-based user interface for date-based browsing of electronically stored documents.

#### References

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Visualization of query results	G06F 16/338
Visualization of clusters	G06F 16/358
Document space presentation for browsing in web context	G06F 16/954

## G06F 16/345

# {Summarisation for human users}

## **Definition statement**

This place covers:

Summarization of text content for presenting to a human user. Normally, important text fragments are extracted and presented to the user.

#### Facets:

- Summarization of text based on users focus.
- Summarization of a collection of related documents.

#### References

#### Informative references

Extracting text features for indexing purposes	G06F 16/313
--	-------------

# Clustering; Classification

#### **Definition statement**

This place covers:

Automatic content-based text classification and clustering. Management of classes or clusters (GUI or machine based) overviews of different content based clustering or classification methodologies.

Facets: A GUI based system to create / modify the names of classes in an existing classification tree.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Manual classification of textual data

G06F 16/38

## G06F 16/353

# {into predefined classes}

# **Definition statement**

This place covers:

Classification or clustering into predefined classes or clusters. The existing classes or clusters may not be changed.

Documents that also should be classified in this group if they do not tell whether classes are created, modified or predefined.

#### Facets:

- · Books are classified by their genre.
- Patent documents are classified into a patent classification scheme.
- A system that reclassifies all documents in a classification tree because the class definitions were changed.

#### G06F 16/355

## {Class or cluster creation or modification}

#### **Definition statement**

This place covers:

Creation or modification of classes or clusters during the clustering or classification process.

#### Facets:

- Groups which become to big are divided by the system.
- If a document does not fit in any existing group and a new group is created for it.
- · Clusters of words of a text are allocated.

# {Browsing; Visualisation therefor}

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Visualization of query results, including e.g. in ranked clusters	G06F 16/338
Visualization of documents or document spaces without clustering	G06F 16/34

## G06F 16/36

## Creation of semantic tools, e.g. ontology or thesauri

#### **Definition statement**

This place covers:

Creation (NOT THE USE) of structures that help in understanding the semantics of words.

# G06F 16/367

# {Ontology}

#### **Definition statement**

This place covers:

Creation of Ontologies (concept/term networks, graphs, trees, etc.).

# G06F 16/374

# {Thesaurus}

#### **Definition statement**

This place covers:

Creation of thesauri (dictionaries, synonym lists).

## G06F 16/38

# Retrieval characterised by using metadata, e.g. metadata not derived from the content or metadata generated manually

#### **Definition statement**

This place covers:

Techniques for usage of metadata for text retrieval. The metadata can be human generated or machine made and may be extracted out of text content.

#### Facets:

- Manual classification systems (such as patent classification schemes) should be classified in this group.
- All kinds of metadata, e.g. citations, barcodes, keywords, etc.
- · Also generation of metadata.

**Definition statement** 

- Keywords extracted and stored as additional data.
- Searching a document in a library using descriptive information, e.g. author, document state, archiving status, etc.

#### References

#### Informative references

of multimedia data, e.g. slideshows comprising image and additional audio data (retrieval of still image data <u>G06F 16/50</u>; retrieval of audio data <u>G06F 16/60</u>; retrieval of video data <u>G06F 16/70</u>)

#### **Definition statement**

This place covers:

- Retrieval of media data incorporating multiple media types, e.g. slideshows comprising image and additional audio data.
- Retrieval of media data where the retrieval algorithm is suitable for various media types.
- Automatic creation of multi-media presentations or documents as a result of a query, e.g. slideshows, multimedia playlists, multimedia albums comprising various media types such as images, text, audio clips, video clips, etc.
- Adaptation of multimedia formats, e.g. selection of multimedia formats based on the capabilities of a client.
- · Generation of multimedia documents.
- · Multimedia databases index structures and management thereof.

{using image data, e.g. images, photos, pictures taken by a user}

#### **Definition statement**

This place covers:

Query formulation using a piece of image data such as a selected image file, a photograph, which currently is captured by the camera of the user, a document, a barcode or scanned text.

#### G06F 16/435

## Filtering based on additional data, e.g. user or group profiles

#### **Definition statement**

This place covers:

Wherein the retrieval is taking further parameters into account, such as user or group profile data for filtering the search space or the results.

#### G06F 16/436

{using biological or physiological data of a human being, e.g. blood pressure, facial expression, gestures}

#### **Definition statement**

This place covers:

Using biological or physiological metrics obtainable by monitoring the human body (e.g. heartbeat, pulse, body temperature, brain waves) or biometric techniques (e.g. fingerprint, iris or retina, face, voice or gait recognition) in formulation or personalisation of queries.

#### G06F 16/437

# {Administration of user profiles, e.g. generation, initialisation, adaptation, distribution}

## **Definition statement**

This place covers:

Techniques for modelling the changing interest of a user over time including manual, semi-automatic or automatic initialisation of user profiles, their maintenance and modification by monitoring the user's history of content selection, his history of interaction with the selected content, the management of the shared profile of a group of users, e.g. profile splitting or stereotyping.

# Presentation of query results

#### **Definition statement**

This place covers:

Where invention information is present in the visual or acoustic presentation of the query results to the user.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Menu, index or table of content presentation of record carriers

G11B 27/32, G11B 27/34

# G06F 16/4387

## {by the use of playlists}

#### **Definition statement**

This place covers:

Methods or interfaces to create, modify or manage multimedia playlists.

## G06F 16/4393

## {Multimedia presentations, e.g. slide shows, multimedia albums}

## **Definition statement**

This place covers:

Multimedia presentations of query results, e.g. slideshow presentations, photo albums enriched with multimedia content, e-books with multimedia content, etc.

## G06F 16/44

# **Browsing; Visualisation therefor**

## **Definition statement**

This place covers:

Wherein a visual metaphor is provided for supporting the search process of the user, and wherein the retrieval is performed through arbitrary or guided browsing.

# G06F 16/444

# {Spatial browsing, e.g. 2D maps, 3D or virtual spaces}

#### **Definition statement**

This place covers:

Using graphical representations of geographical, urban or virtual space, e.g. 2D or 3D maps, city plans, virtual spaces, as a paradigm for browsing representations of multimedia objects.

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Interaction with 3D GUI environments in general

G06F 3/04815

#### G06F 16/447

# {Temporal browsing, e.g. timeline}

## **Definition statement**

This place covers:

Using graphical representations of time, e.g. timelines, calendars, diaries, as a paradigm for browsing representations of multimedia objects.

## G06F 16/45

## Clustering; Classification

#### **Definition statement**

This place covers:

Automatic content-based multimedia document classification and clustering. Management of classes or clusters (GUI or machine based), overviews of different content-based clustering or classification methodologies.

#### G06F 16/48

# Retrieval characterised by using metadata, e.g. metadata not derived from the content or metadata generated manually

#### **Definition statement**

This place covers:

Retrieval or indexing of multimedia data using metadata.

Note: Group <u>G06F 16/48</u> concerns the use of metadata not derived from the multimedia content, or manually generated information, such as bibliographic information (e.g. title, composer, etc.), usage information, user ratings, tags etc.

These data may be generated by automatic annotation of multimedia data, generation from existing data sources, e.g. data mining, collaborative annotation, creation of semantic ontologies, tagging.

#### G06F 16/483

## using metadata automatically derived from the content

#### **Definition statement**

This place covers:

Retrieval or indexing of multimedia data using metadata that automatically is derived from the multimedia content.

# Informative references

Attention is drawn to the following places, which may be of interest for search:

Query formulation using audio data	G06F 16/433
Query formulation using image data	G06F 16/434

## G06F 16/487

# using geographical or spatial information, e.g. location

# **Definition statement**

This place covers:

Where the feature used for retrieval or indexing is any kind of absolute, relative or fuzzy representation of location, e.g. GPS coordinates, postal address, rooms of a building, user's car.

## G06F 16/489

# **{using time information}**

#### **Definition statement**

This place covers:

Where the feature used for retrieval or indexing is of any kind absolute, relative or fuzzy representation of time, e.g. hour, date, time of the day, season of the year, rush hour, sunset or holiday.

# G06F 16/50

# of still image data

## **Definition statement**

This place covers:

Systems and methods (1) for retrieving digital still images in databases or (2) related to how metadata of the image type is used to retrieve other information, possibly of a different type.

#### References

#### Informative references

image-based pattern recognition	

# {using shape and object relationship}

#### **Definition statement**

This place covers:

Using recognized shapes or spatial relationships between objects/blocks of the images for retrieval.

#### G06F 16/5862

# {using texture}

#### **Definition statement**

This place covers:

Using texture descriptors for the retrieval.

## G06F 16/5866

**(using information manually generated, e.g. tags, keywords, comments, manually generated location and time information)** 

## **Definition statement**

This place covers:

Wherein the metadata used for retrieval has been generated manually, for example, human labels, tags, keywords, comments or manually entered time and location data (as opposed to automatically obtained time or GPS provided data).

## G06F 16/587

# using geographical or spatial information, e.g. location

## **Definition statement**

This place covers:

Where the feature used for retrieval or indexing is any kind of absolute, relative or fuzzy representation of location, e.g. GPS coordinates, postal address, rooms of a building, user's car.

#### G06F 16/60

## of audio data

#### **Definition statement**

This place covers:

Retrieval of audio data from audio databases, e.g. retrieval of songs, by using content features or bibliographical data associated with the audio data.

#### References

# **Query formulation**

# **Definition statement**

This place covers:

Wherein the contribution is in specific query formulation aspects supporting the user in inputting a query.

## {Query by example, e.g. query by humming}

#### **Definition statement**

This place covers:

Formulation of the query predicate as an existing/example audio content, e.g. query by humming, or using a recorded piece of audio data as example.

# G06F 16/635

# Filtering based on additional data, e.g. user or group profiles

#### **Definition statement**

This place covers:

- · Filtering rules.
- · Retrieval personalisation.
- · Generation, learning, modification and use of user profiles.
- Monitoring of user activities for profile generation (in particular generation and use of reproduction/playback histories/logs).
- Relevance feedback.

## G06F 16/636

# {by using biological or physiological data}

# **Definition statement**

This place covers:

Using biological or physiological metrics obtainable by monitoring the human body (e.g. heartbeat, pulse, body temperature, brain waves) or biometric techniques (e.g. fingerprint, iris or retina, face, voice or gait recognition) in formulation or personalisation of audio gueries.

## G06F 16/637

# {Administration of user profiles, e.g. generation, initialization, adaptation or distribution}

## **Definition statement**

This place covers:

Techniques for modelling the changing taste of a user over time including manual, semi-automatic or automatic initialisation of user profiles, their maintenance and modification by monitoring the user's history of audio content selection, his history of interaction with the selected content, the management of the shared profile of a group of users, e.g. profile splitting or stereotyping.

#### G06F 16/638

#### Presentation of query results

#### **Definition statement**

This place covers:

Visual or acoustic presentation of the query results to the user.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Menu, index or table of content presentation of record carriers	G11B 27/32, G11B 27/34
---	------------------------

#### G06F 16/639

## {using playlists}

#### **Definition statement**

This place covers:

Methods presenting the results of query for audio data in form of a list which defines an order between the audio data used during the replay of the audio data, e.g. methods or interfaces to create, modify and manage audio playlists.

## G06F 16/64

# Browsing; Visualisation therefor (generation of a list or set of audio data G06F 16/638)

#### **Definition statement**

This place covers:

Browsing, e.g. a list or a collection/database of song titles or images or icons representing audio data. Such lists or sets of audio data representations may be the results of a querying operation. However, the contribution is the browsing method.

## References

## Limiting references

This place does not cover:

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Trick modes	G11B 27/005
Browsing through audio recorded on operating discs	G11B 27/105

## G06F 16/65

# Clustering; Classification

#### **Definition statement**

This place covers:

Automatic audio classification and clustering. Management of classes or clusters (GUI or machine based), overviews of different content-based clustering or classification methodologies.

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Clustering techniques for pattern recognition	G06F 18/23
Classification techniques for pattern recognition	G06F 18/24

## G06F 16/68

# Retrieval characterised by using metadata, e.g. metadata not derived from the content or metadata generated manually

#### **Definition statement**

This place covers:

Indexing and retrieval of audio data using metadata.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Metadata derived by content-analysis	G06F 16/683
Programmed access in sequence to addressed parts of tracks of operating discs	G11B 27/105

## G06F 16/683

# using metadata automatically derived from the content

#### **Definition statement**

This place covers:

Retrieval and/or indexing methods using features derived from the audio content. This subgroup covers the mere use of audio content features in the context of audio data retrieval. This metadata comprises, for example, descriptors, fingerprints, signatures, MEP-cepstral coefficients, musical score, tempo.

## References

Indexing by using information signals detectable on the record carrier and recorded by the same method as the main recording	G11B 27/28

# {using automatically derived transcript of audio data, e.g. lyrics (speech recognition G10L 15/00)}

#### **Definition statement**

This place covers:

Text data used to retrieve audio content, e.g. text derived from speech or music, phonetic transcript, music scores (sheet music), etc.

#### References

#### Limiting references

This place does not cover:

Speech recognition	G10L 15/00
--------------------	------------

#### G06F 16/686

{using information manually generated, e.g. tags, keywords, comments, title or artist information, time, location or usage information, user ratings}

#### **Definition statement**

This place covers:

Where the retrieval and/or indexing method uses manually generated information, e.g. data created by humans and added to the audio data at a post-production phase by manual annotation/tagging, e.g. title, song writer, interpret, users' tags, comments or annotations etc.

## G06F 16/687

# using geographical or spatial information, e.g. location

#### **Definition statement**

This place covers:

Where the feature used for retrieval or indexing is any kind of absolute, relative or fuzzy representation of location, e.g. GPS coordinates, postal address, rooms of a building, user's car.

# G06F 16/70

#### of video data

## **Definition statement**

This place covers:

- · Video retrieval using content features.
- Video retrieval using bibliographical data.
- Details or video query formulation and video query processing.
- Browsing videos and the internal structure of videos.
- · Presenting video query results.
- · Video database index structures and management thereof.

**Definition statement** 

Video data model used in this group: the structure of this group relies on the following data model of video. Video content is the originally produced data comprising:

- The visual data (video frames).
- Accompanying audio track(s).
- Original textual content (typically subtitles, which can be coded and stored/transmitted either in binary/visual format or in textual format). Whatever data is added to video later, e.g. at a postproduction phase, is referred to as bibliographical data or metadata.

#### References

#### Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Video data retrieval specially adapted for selective content distribution,	H04N 21/00
e.g. interactive television or video on demand [VOD]	

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Retrieval of multimedia	G06F 16/40
Image retrieval	G06F 16/50
Audio retrieval	G06F 16/60
Recognising patterns	G06F 18/00
Image analysis	G06T 7/00
Editing or indexing of data stored based on relative movement between record carrier and transducer, e.g. video data	G11B 27/00
Source coding or decoding of digital video signal	H04N 19/00

# G06F 16/71

# Indexing; Data structures therefor; Storage structures

#### **Definition statement**

This place covers:

Specific indexing aspects, data structures or storage structures for video data.

#### References

#### Informative references

Indexing specially adapted for contents retrieved by relative movement between record carrier and transducer	G11B 27/10
Table of contents on a record carrier	G11B 27/327

## Querying

#### **Definition statement**

This place covers:

Processing details of video retrieval requests.

#### G06F 16/732

## **Query formulation**

#### **Definition statement**

This place covers:

Query formulation and processing for the retrieval of video data.

#### G06F 16/7328

{Query by example, e.g. a complete video frame or video sequence (graphical querying G06F 16/7335)}

## **Definition statement**

This place covers:

Formulation of the query predicate as an existing/example of video content, e.g. a video sequence or its excerpt/clip; typically a content-based descriptor computed from said example content during query processing; if there is contribution in the usage of a particular content feature or metadata, this should be classified under a relevant <u>G06F 16/78</u> subgroup, respectively; if there is a contribution in a particular content feature extraction, characterisation or analysis, this should be classified under the relevant <u>G06F 18/00</u>, <u>G06V</u> or <u>G06T 7/00</u> subgroup(s).

#### References

#### Limiting references

This place does not cover:

## G06F 16/7335

{Graphical querying, e.g. query-by-region, query-by-sketch, query-by-trajectory, GUIs for designating a person/face/object as a query predicate (enduser interface involving hot spots associated with the video H04N 21/4725; end-user interface for selecting a Region of Interest H04N 21/4728)}

#### **Definition statement**

This place covers:

Graphical user interfaces [GUIs] for specifying graphical query predicates interactively (a mere selection of an example video sequence as a query predicate shall be classified in G06F 16/7328). These GUIs may for example allow a specification of sought-for regions, to sketch a desired scene, a trajectory, or to designate a person, a face or an object as query predicate.

#### Limiting references

This place does not cover:

End-user interface involving hot spots associated with the video	H04N 21/4725
End-user interface for selecting a Region of Interest	H04N 21/4728

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

# G06F 16/7343

# {Query language or query format}

#### **Definition statement**

This place covers:

Query formulation using a specific query language or format of the query, e.g. SQL variants adapted for video or specific formats for expressing query parameters.

## G06F 16/735

# Filtering based on additional data, e.g. user or group profiles

#### **Definition statement**

This place covers:

- Filtering rules.
- · Retrieval personalisation.
- Generation, learning, modification and use of user profiles.
- Monitoring of user activities for profile generation (in particular generation and use of reproduction/ playback histories/logs).
- Relevance feedback.
- Playlist-based retrieval and playlist generation.

# Presentation of query results

## **Definition statement**

This place covers:

Presentation of query results, in particular visual presentation methods/interfaces.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Presentation in form of a video summary	G06F 16/739
Browsing a video collection	G06F 16/743
Two dimensional image generation	G06T 11/00

# G06F 16/739

{in form of a video summary, e.g. the video summary being a video sequence, a composite still image or having synthesized frames}

# **Definition statement**

This place covers:

- Video summarisation, also called video abstraction, which produces a shorter and/or more
  condensed version of the original video. For example, video skimming produces a shorter video
  sequence at the output, typically comprising a subset of key frames extracted from the original
  video or a subset of excerpts / sub-sequences of the original video.
- Composite still images (2-D or 3-D), called, for example, a video mosaic, storyboard, video poster or "movie bar", typically comprising re-sized key-frames extracted from the original video, arranged into the still image like in a comic book or like stones in a mosaic.
- Video sequences comprising artificial (synthesized) frames, e.g. with an artificial (synthesized) view not existing in any of the single frames of the original video, with a stitched panorama showing a broader view and/or more motion than any single original frame or with a view having overlaid multiple instances of the same moving object.

Motion analysis	G06T 7/20

# G06F 16/7864

# {using domain-transform features, e.g. DCT or wavelet transform coefficients}

## **Definition statement**

This place covers:

Using features of a specific domain transform as the low-level visual features, e.g. wavelet or Discrete + Cosine Transform (DCT) transform coefficients; this approach is often referred to as retrieval or indexing "in compressed domain".

{using information manually generated, e.g. tags, keywords, comments, title and artist information, manually generated time, location and usage information, user ratings}

## **Definition statement**

This place covers:

Retrieval and/or indexing methods using information not-derived from the video content, e.g. data created by humans and added to video at a post-production phase by manual annotation/tagging, e.g. title, author, director, actors' names, users' tags, comments, annotations, usage information, user ratings etc.

# G06F 16/787

# using geographical or spatial information, e.g. location

#### **Definition statement**

This place covers:

Retrieval or indexing where the features used are any kind of absolute, relative or fuzzy representations of location, e.g. GPS coordinates, postal address, rooms of a building, user's car.

# G06F 16/80

of semi-structured data, e.g. markup language structured data such as SGML, XML or HTML (content-based retrieval of web data G06F 16/95)

#### **Definition statement**

This place covers:

Semi-structured data, which is a form of structured data that does not conform with the formal structure of data models associated with relational databases or other forms of data tables, but nonetheless contains tags or other markers to separate semantic elements and enforce hierarchies of records and fields within the data.

# Indexing, e.g. XML tags; Data structures therefor; Storage structures

## **Definition statement**

This place covers:

Creation or maintenance of an index comprising tag (structure) and content information that is used to retrieve information in semi-structured documents.

# G06F 16/83

# Querying

# **Definition statement**

This place covers:

Assembly, generation and maintenance of semi-structured (xml) databases as well as operations performed on semi-structured (xml) databases. Querying of said databases is also encompassed (XQuery etc.).

# G06F 16/832

# **Query formulation**

# **Definition statement**

This place covers:

Example:

• Comparative analysis of XML query languages; graphical XML query language.

## G06F 16/835

# **Query processing**

## **Definition statement**

This place covers:

Examples:

- Implementing an XML query language.
- Query processing in Xyleme a native XML DBMS.
- Implementing an XML query language.

# G06F 16/8358

# {Query translation}

## **Definition statement**

This place covers:

- Translation of a query into internal representation.
- Translation of XML specific query language into SQL as internal representation.

# {Query optimisation}

## **Definition statement**

This place covers:

## Example:

• XML query (XQuery) optimization and normalization.

# G06F 16/8373

# {Query execution}

# **Definition statement**

This place covers:

Execution of one or more (already generated and optimized) query execution plan(s).

# Examples:

- Pipelined query execution of a ranking operator for XQuery.
- Intra-document indices to improve XQuery processing over XML streams.

# G06F 16/84

# Mapping; Conversion

## **Definition statement**

This place covers:

Mapping or conversion of semi-structured documents to other structures.

# G06F 16/86

# {Mapping to a database}

# **Definition statement**

This place covers:

Mapping of semi-structured documents to databases (relational, object oriented, etc.).

# G06F 16/88

# {Mark-up to mark-up conversion (conversion for visualization in web browsing G06F 16/9577)}

# **Definition statement**

This place covers:

Normalisation or conversion of semi-structured documents into another semi-structured scheme.

# Retrieval characterised by using metadata, e.g. metadata not derived from the content or metadata generated manually

# Special rules of classification

Documents describing retrieval of arbitrary data types based on a specific type of metadata in addition may be classified in the group corresponding to the data type used for the retrieval, depending on the level of disclosed details concerning the data type used for retrieval.

# G06F 16/93

# **Document management systems**

#### **Definition statement**

This place covers:

- Organisation of collections of digital documents (scanned, OCRed, semi-structured or unstructured representation) in document library databases.
- Retrieval of digital representations of documents.
- Techniques for associating physical paper documents with their digital representation as stored in a database, e.g. by attaching barcodes to documents.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Retrieval of image data	G06F 16/50
Retrieval of semi-structured data	G06F 16/80

# G06F 16/94

# {Hypermedia (Hyperlinking G06F 40/134)}

## **Definition statement**

This place covers:

- · Systems and methods for hyperlinking in documents.
- Computed links, including dynamically determined anchor and targets of links.
- Management of annotations linked to other documents.

## References

#### Limiting references

This place does not cover:

Hyperlinking	G06F 40/134

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Navigation in hyperlinked Web environments	G06F 16/954
--	-------------

# G06F 16/95

#### Retrieval from the web

#### **Definition statement**

This place covers:

- Systems and methods for browsing and retrieving information on the web.
- Aspects in subgroups that deal with search engines specifics (e.g. crawling, indexing, search
  personalisation), web navigation, web site management (e.g. content collection, organisation
  and management of web sites, publication of same) and browsing optimisations (e.g. for quicker
  access or adequate visualisation).

# Relationships with other classification places

Close relationship with <u>H04L 65/40</u> and <u>H04L 67/00</u>, especially due to particulars in OSI model's level 7: application layer.

## References

#### Informative references

# G06F 16/951

# Indexing; Web crawling techniques

# **Definition statement**

This place covers:

- Systems and methods for collecting, organising or managing indexation of information originating from more than one data source in order to support keyword based searching.
- Web retrieval techniques dealing specifically with the nature of the web:
- Heterogeneity of data, users and devices.
- · Large number of documents and users.
- · Lack of detailed knowledge about the data sources.
- · Specific web retrieval techniques such as:
- · Crawling techniques to discover/navigate sites and document hyperlinks.

**Definition statement** 

- · Meta-search engines:
- Remote systems interactions for web retrieval purposes, e.g. distributed and remote indexing of web content.
- Handling documents in different languages.

#### References

#### Informative references

	*
Text content indexation	G06F 16/31

# Special rules of classification

Local, keyword-based search engines should be classified in the appropriate subgroups according to the retrieved type of data; for example, if dealing with: unstructured text, see G06F 16/30.

# G06F 16/9535

# Search customisation based on user profiles and personalisation

## **Definition statement**

This place covers:

- Techniques to select the information conveyed to the user during his retrieval session, usually in complement to an explicit user query request.
- Personalisation of queries and/or of returned results.

#### Facets which include:

- Censoring by filtering documents (e.g. by keyword or objectionable images).
- Using inclusive/exclusive lists of sites/pages to define viewable content.
- Sharing user profile knowledge or identifying common interests to identify relevant information.
- Systems using a single user profile to filter information or enhance query.
- · Aggregation of information (personalised online newspapers).
- User navigation monitoring to identify user interests and consequent query refinement.

#### References

# Informative references

Messaging using geographical location information	H04L 51/222
Network protocols in which the network application is adapted for the location of the user terminal	H04L 67/52
Services or facilities specially adapted for wireless communication network making use of the locations of the users	H04W 4/02

# G06F 16/954

# Navigation, e.g. using categorised browsing

## **Definition statement**

This place covers:

- Interactive ways to help the user in recognising desired information in web sites/web pages.
- Methods and systems to help an interactive navigation within the document space on the web, in a search narrowing approach, including providing suggestions of pages to visit which appear relevant to the user's search path.
- Methods and systems whereby visual cues typically are provided to show existing relationships among documents or to provide a document space visualisation.
- Passive browsing, guided tours, wherein a list of web pages to visit is prepared in advance or automatically devised.

### Examples:

- Methods can be based on a classification or clustering approach to organise the documents.
- Categorised browsing, portals, virtual worlds' tours or visual networks of documents.
- Using a query to select a starting point for navigation, showing how the returned documents relate to each other.

# using information identifiers, e.g. uniform resource locators [URL]

# **Definition statement**

This place covers:

Cases where the user already has an identifier for the information he wants to retrieve. Typically, the identifier is a product code or a bookmark. The general idea is that the user does not have to blindly search for the information.

# G06F 16/9554

# {by using bar codes}

#### **Definition statement**

This place covers:

- Use of a barcode reader (e.g. to read a UPC code or even a URL printed on a product) connected to a computer with a browser which fetches the relevant information on the Internet.
- Also systems wherein the user inputs the product code directly in a browser link field.

## Facets:

- The code can be a direct URL or one that needs to be first resolved in an intermediary server.
- The code can further comprise commands or information used for personalising the search.

## References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

# {Details of hyperlinks; Management of linked annotations}

## **Definition statement**

This place covers:

- Details of hyperlinking in hypertext.
- Computed links, including dynamically determined anchor and targets of links.
- · Management of annotations linked to other hypertext.

## References

#### Informative references

Navigation in hyperlinked web environments	G06F 16/954

# {Bookmark management}

## **Definition statement**

This place covers:

- Methods and systems whereby the browser bookmarks are used to reference, organise, classify and access information.
- Local or central bookmark storage, managed by an individual or an organisation.
- Related management functions such as: replace in bulk, share bookmarks, detect broken links, add comments for later reference, extract from files, enhance visual aspect (e.g. icons, colours for easier recognition), automatic extraction (from pages), classification, etc.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Bookmarks	Represent information already identified as relevant for the user; they are user oriented and they represent information of interest already identified.
Portals	Present a way for information yet to be discovered, and they are not specific to a user.

# G06F 16/9566

# {URL specific, e.g. using aliases, detecting broken or misspelled links}

## **Definition statement**

This place covers:

- Variations of URLs in order to facilitate or simplify the access to the information (e.g. alias in non-Latin characters, tiny URLs).
- These URLs can refer to existing documents but also to virtual pages created at access-time or accessing transparently other links.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Address allocation to terminals or nodes connected to a network	H04L 61/00
Use of aliases or nicknames in arrangement for managing network naming	H04L 61/30
Addressing or naming in networks with short addresses	H04L 2101/672

# G06F 16/957

# Browsing optimisation, e.g. caching or content distillation

## **Definition statement**

This place covers:

Optimisations in the browsing process concerned with faster or simpler access to information.

**Definition statement** 

Improvements that enhance or simplify the understanding of data or the visualization of data on the user's device. These include among others:

- Identifying changes in pages or sections of pages.
- Combined printing of web documents; for example, several web pages forming a single document.
- · Combined access to CD-ROM information with internet browsing.
- Using specific data viewers (e.g. Mime dependent).
- In general, improvements with the browsing process.

## References

## Informative references

Attention is drawn to the following places, which may be of interest for search:

Voice browsers, e.g. interpreting VoiceXML, for providing telephonic	H04M 3/4938
information services	

# G06F 16/9574

# {of access to content, e.g. by caching}

# **Definition statement**

This place covers:

- Ways to speed up access to information on the Internet, typically, via caching and/or prefetching.
- · Content dissemination systems.
- Look-ahead (Web) caching.
- Caching static and/or all of portions of dynamic data.
- Caching or hoarding of Web content on local removable storage (CDs, DVDs, USB keys) for later browsing.

## References

### Informative references

Attention is drawn to the following places, which may be of interest for search:

Accessing, addressing or allocating within memory systems and caches	G06F 12/08
Network arrangements for storing temporarily data at an intermediate stage, e.g. caching	H04L 67/568

# Special rules of classification

The type of caching referred to in this group usually occurs at an application level; it is content aware, meaning that the system has some knowledge about the data content and will decide what and how to cache it based on this content.

This is opposed to system level caching, where the data content is transparent to the cache.

# {Optimising the visualization of content, e.g. distillation of HTML documents}

## **Definition statement**

This place covers:

- Methods and systems manipulating web page content (e.g. HTML) for the purpose of changing the presentation of a page, in order to enhance the comprehension or visual rendering of its content.
- Adapting content for providing support to devices with various displays (e.g. PDA small screen).
- · Reorganizing or simplifying the page layout.
- Using user profiles or templates to create or change the page presentation.

#### References

#### Informative references

Attention is drawn to the following places, which may be of interest for search:

Web page authoring	G06F 40/00
Manipulation for advertisement or marketing purposes	G06Q 30/00
Message adaptation based on network or terminal capabilities	H04L 51/06
Protocols for network applications adapted for terminals or networks with limited resources and for terminal portability	H04L 67/04
Arrangements for conversion or adaptation of application content or format	H04L 67/565

# Special rules of classification

While the manipulation of navigation items in a Web page (e.g. hyperlinks) to simplify browsing (for example associating a visible numerical code to links on a page and allowing keying in the code instead of activating the link with a pointer device) pertains to this group, document navigation techniques themselves should be classified in G06F 16/954.

May also include simple cases of document summarisation (priority to <u>G06F 16/30</u>) as long as the goal is page visualisation and not to be used for the purpose of document indexation. Typically uses an HTML parser (for parsing techniques used in software development see <u>G06F 8/427</u>). Format conversions not presentation dependent or related are classified in <u>G06F 16/1794</u>.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Distillation	Process of reducing the amount of information before delivery, in
	particular to eliminate information which cannot be rendered on the
	end device (colour on a black and white screen or downscaling of
	images in a Web page for a small screen)

# Organisation or management of web site content, e.g. publishing, maintaining pages or automatic linking

#### **Definition statement**

This place covers:

Organisation or management of web sites: how data is collected, stored and organised in a server, and how the information is published (e.g. dynamic web page servers) and made available or sent to users such as:

- Creation of site maps
- Registration of sites/pages in search engines
- Link organisation and maintenance
- · Push channels, syndication and subscription systems
- Web CMS (Content Management Systems) repositories

# {Document structures and storage, e.g. HTML extensions}

#### **Definition statement**

This place covers:

- The way documents are represented and their structures are used.
- Extensions to or special uses of the HTML coding language.

# G06F 17/10

Complex mathematical operations {(function generation by table look-up G06F 1/03; evaluation of elementary functions by calculation G06F 7/544)}

#### **Definition statement**

This place covers:

Algorithms for:

- performing complex mathematical operations (e.g. matrix-vector multiplication <u>G06F 17/16</u>, discrete Fourier transform <u>G06F 17/141</u>);
- solving generic mathematical problems (e.g. system of linear equations G06F 17/12);
- manipulating mathematical objects (e.g. matrix factorization G06F 17/16);

evaluating complex mathematical functions (e.g. by interpolation of known function values G06F 17/17);

- computing statistical descriptions of data sets (e.g. histogram computation G06F 17/18)
- mathematical analysis of data not provided elsewhere (e.g. mathematical spectral analysis
  algorithms based on the discrete Fourier transform G06F 17/141) and the implementation of such
  algorithms
- as computer programs (for general-purpose digital processors), eventually with specially adapted data structures for storing the mathematical objects upon which the operations are performed (e.g. specific matrix storage formats), or
- as dedicated digital hardware circuits, described on the level of adders, subtractors, multiplexers, etc.

The groups in G06F 17/10 are function-oriented and are intended to cover mathematical methods and devices which are in principle not tied to a particular application field.

To be classified in G06F 17/10 and subgroups, a document should not merely disclose how a (technical) problem in an application field is reduced to a particular mathematical problem (e.g. a particular set of equations) but it must also disclose details of the mathematical algorithm used to solve this particular mathematical problem. Furthermore, the mathematical problem and/or the mathematical algorithm used to solve it should also be sufficiently generic in the sense that they may be relevant outside the particular application field (even if this fact is not mentioned in the document itself).

Subject-matter classified in group G06F 17/10 itself (because it does not fall in any of the subgroups) includes among others:

- Numerical computation of the derivative of a function;
- Numerical integration of a function, e.g. Using monte-carlo methodology;
- Methods enabling symbolic mathematical calculations, e.g. In computer algebra systems;
- · Graph algorithms not classified elsewhere.

# Relationships with other classification places

When a document discloses a mathematical algorithm applied in a particular application field, classification in the relevant application-related group(s) should also be considered.

# Special rules of classification

A document disclosing a device which is configurable to perform several complex mathematical operations (e.g. a circuit configurable to perform either a DFT or a convolution operation) is to be classified in the relevant groups (G06F 17/141 and G06F 17/15) if the document discloses details of the computations which are specific to the different mathematical operations. However, if no such details are provided, the document is to be classified only in the broadest group covering these operations. For example, a document disclosing a circuit able to perform any linear transform, including DFT and DCT, without providing details specific to the DFT or DCT computations, is to be classified only in G06F 17/14.

# G06F 17/11

for solving equations {, e.g. nonlinear equations, general mathematical optimization problems (optimization specially adapted for a specific administrative, business or logistic context G06Q 10/04)}

## **Definition statement**

This place covers:

- Solving non-linear equations (e.g. By iterative methods)
- Mathematical algorithms for solving general mathematical optimization problems (e.g. Linear, non-linear, mixed-integer or combinatorial optimization problems)

# Relationships with other classification places

The use of mathematical optimization to solve a problem in an administrative, business or logistic context is usually classified in <u>G06Q 10/04</u>. However, if the document provides also details regarding the mathematical algorithm used for solving the resulting mathematical optimization problem and if the mathematical optimization problem and/or the mathematical algorithm are sufficiently generic (i.e. if they may be relevant outside the particular application context), the document should also be classified in <u>G06F 17/11</u>.

# G06F 17/40

# Data acquisition and logging (for input to computer G06F 3/00)

#### **Definition statement**

This place covers:

Logging and acquisition of digital data.

Data logging, the act of storing and possibly organising collected data in such a way that some (temporal) ordering between the data is kept.

Log processing that is independent of the semantics of the log content.

# Relationships with other classification places

In case the representation of the data is changed during the act of storing, this change process is considered data conversion. Data conversion in general, i.e. whereby the same information is represented with a different sequence or number of digits is classified in <u>H03M 7/00</u>.

# **Special rules of classification**

Data acquisition normally always is linked to a particular application in the form of specifying what data is being acquired or from what entity data is being acquired and must be classified with those applications.

## G06F 18/00

# Pattern recognition

#### **Definition statement**

This place covers:

Pattern recognition techniques in general.

These include in particular:

- · Pre-processing, data cleansing;
- · Analysing;
- · Post-processing;
- Software arrangements specially adapted for pattern recognition;
- Pattern recognition of signals other than images or video.

#### Note:

Pattern recognition refers to the automated recognition of patterns and regularities in data and includes using statistical or machine learning techniques to solve problems such as authentication, identification, classification or clustering.

# Relationships with other classification places

Systems and methods for retrieving digital information stored in databases, data repositories or file systems, locally or remotely, retrieving structured data, semi-structured data, text, audio, image, video or multimedia data from databases, or for managing document libraries are classified in group G06F 16/00.

Higher-level interpretation and recognition of images or videos, which includes pattern recognition, pattern learning and semantic interpretation as fundamental aspects, are classified in subclass <u>G06V</u>. These aspects involve the detection, categorisation, identification and authentication of image or video patterns by acquiring, pre-processing, extracting distinctive features or matching, supervised or unsupervised clustering or classification of these features or representations derived from them leading to one or several decisions, related confidence values (e.g. probabilities) or classification/clustering labels, for explanatory purposes or to derive a certain meaning.

Computing systems where the computation is not based on a traditional mathematical model or computer, for example neural network architectures, are classified in subclass <u>G06N</u>. In particular, techniques for machine learning are covered by group <u>G06N</u> 20/00.

# **Special rules of classification**

This main group covers functional aspects of pattern recognition, i.e. algorithms or computer systems specifically designed therefor, regardless of a particular application and, therefore, of any particular type of data. In this group, it is desirable to add the indexing codes of group <u>G06F 2123/00</u>.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Authentication	Verifying the identity of a sample using a test of genuineness. It generally involves a one-to-one comparison with the genuine (authentic) sample.
Categorisation	Assigning a data sample to a class according to certain distinguishing properties (or characteristics) of that class, and it generally involves a one-to-many test in which one data sample is compared with the characteristics of several classes.
Classification	Assigning labels to patterns.
Clustering	Grouping data samples in groups or classes based on their properties (or characteristics) and it generally involves a manyto-many (dis)similarity test. Grouping or separating patterns according to their closeness or dissimilarity.
Feature extraction	Deriving descriptive or quantitative measures from data.
Identification	In the context of collecting of data samples, identification means selecting a particular sample having a (predefined) characteristic which distinguishes it from the others. Several data samples are generally matched against the characteristic sample in a many-to-one process.
Pattern patterns	Data having characteristic regularity, or a representation derived from it, having some explanatory value or being able to provide an interpretation.

# G06F 18/10

# Pre-processing; Data cleansing

## **Definition statement**

This place covers:

Removing bad data or interpolating missing values, finding hidden correlations in the data, identifying sources of data that are the most accurate and determining which data items are the most appropriate for use in analysis.

## References

Image analysis	G06T 7/00
----------------	-----------

# G06F 18/211

# Selection of the most significant subset of features

## **Definition statement**

This place covers:

Feature selection by using evolutionary computational techniques, e.g. genetic algorithms.

Feature selection by ranking or filtering the set of features, e.g. using a measure of variance or of feature cross-correlation.

Feature selection by evaluating class separability based on distance or (dis)similarity measures between (sub)sets of data samples. The intention for adopting distance metrics defined on features is to embed objects belonging to the same class, i.e. small intraclass distances, while embedding objects of different classes far away from each other in different classes, i.e. large interclass distances.

The processing can be iterative and, starting with no samples, it can successively include data samples by evaluating a model fit criterion, i.e. "forward" selection, or starting with all the samples and successively delete samples by evaluating a model fit criterion, i.e. backward elimination.

# G06F 18/2115

# by evaluating different subsets according to an optimisation criterion, e.g. class separability, forward selection or backward elimination

## **Definition statement**

This place covers:

Finding a set of features that are effective for classification, and determining whether the resulting features or feature dimensions are the most powerful for classification, e.g. such as class separability.

Ensemble learning	G06N 20/20

## G06F 18/22

# Matching criteria, e.g. proximity measures

#### **Definition statement**

This place covers:

Matching which involves comparison of data values, combinations thereof or features derived from them, in which one entity is considered as a template pattern and the other is the input pattern (template matching). The matching process might involve transforming the patterns to accommodate for distortions.

The proximity measures used during matching may include classical distances, such as Euclidian distances, or more involved distances, divergences or other measures between probability density functions [PDF] or other statistical representations (e.g. mean, standard deviation, moments, kurtosis or Chi-square distance), for instance:

- Kullback-Leibler divergence;
- · Mutual Information;
- · Bhattacharyya distance;
- · Hamming distance;
- Earth mover, Wasserstein distance
- · Chi-square distance;
- Hellinger distance.

## G06F 18/23

# Clustering techniques

## **Definition statement**

This place covers:

Techniques of grouping patterns together in order to reveal a certain structure or a meaning. These techniques aim at identifying different groups of similar entities by assigning them to a group (cluster) according to a measure of their similarity or, on the opposite, identify dissimilar items to split them into different groups. Separability is determined by measuring the similarity/dissimilarity, mostly to minimise the intra-cluster variations while maximising the inter-cluster ones. This is usually performed in a high-dimensional feature space constructed by extracting features, but can also be performed in the original domain.

Any pattern may belong exclusively to a single cluster (hard clustering) or it may belong simultaneously to more than one cluster up to a certain degree (fuzzy clustering) according to a proximity measure that may determine similarity or dissimilarity. Depending on the clustering method

used, proximity may be defined (a) between vectors, (b) between a vector and a set of vectors (or a cluster), and (c) between sets of vectors (or different clusters).

Examples of proximity measures are: dissimilarity measures (based on I<sub>1</sub>, I<sub>2</sub>, and I norms), similarity measures (inner product, cosine, Pearson's correlation coefficient, Tanimoto distance, etc.).

Different clustering algorithms include:

- a) clustering based on statistical measures (which mainly employ numerical data) which adopt a cost function J related to possible groupings which is subject to a global or local optimisation criterion, and return a clustering that optimises J. Examples of algorithms are:
  - Hard clustering algorithms, where a vector belongs exclusively to a specific cluster, e.g. k-means, k-medoids, Linde-Buzo-Gray, ISODATA, DBSCAN or Neural Gas;
  - Fuzzy clustering algorithms, where a vector belongs to a specific cluster up to a certain degree,
     e.g. fuzzy c-means, Adaptive Fuzzy C-Shells [AFCS], Fuzzy C Quadric Shells [FCQS] or Modified Fuzzy C Quadric Shells [MFCQS];
  - Probabilistic clustering algorithms, which follow Bayesian classification arguments and in which each vector is assigned to the cluster according to a probabilistic set-up, e.g. Expectation-Maximization [EM], Gaussian Mixture Model [GMM] or Mean-Shift;
- b) graph-based clustering, e.g. minimum spanning tree [MST] clustering, clustering based on directed trees, spectral clustering or graph-cut optimisation;
- c) Competitive learning algorithms for clustering in which a set of representatives is selected and the goal is to move each of them to regions of the vector space that are "dense" in terms of other vectors. Examples are leaky learning algorithm, Self-Organizing Maps [SOM] or Learning Vector Quantization [LVQ].

Hierarchical clustering is one of the popular techniques from the class of graph-based clustering, with its agglomerative or divisive variants. Various criteria can be used for determining the groupings, such as those based on matrix theory involving dissimilarity matrices. Algorithms included in this scheme are:

- · Single link algorithm;
- · Complete link algorithm;
- Weighted Pair Group Method Average [WPGMA];
- Unweighted Pair Group Method Average [UPGMA];
- Weighted Pair Group Method Centroid [WPGMC];
- Ward or minimum variance algorithm.

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

AFC	Adaptive Fuzzy Clustering
-----	---------------------------

AO	Alternative Optimisation
ССМ	Compatible Cluster Merging
DBSCAN	Density-Based Spatial Clustering of Applications with Noise, a non- parametric clustering algorithm which does not require specifying the number of clusters in advance.
FCSS	Fuzzy C-Spherical Shells
FCV	Fuzzy C-Varieties
FHV	Fuzzy Hyper Volume
KNN	k-Nearest Neighbour; a classification algorithm which, for a given data sample, chooses the k most similar samples from a training set, retrieves their respective class labels, and assigns a class label to the data sample by majority decision; variant: 1NN, which is KNN for k=1.
LVQ	Learning Vector Quantisation

# G06F 18/24

# **Classification techniques**

# **Definition statement**

#### This place covers:

Classification in general, namely identifying to which category or which set of categories (classes) a new data or some other representation originating from it belongs, on the basis of a training set of data containing observations (or instances) whose category membership is known. Often, the individual observations are analysed into a set of quantifiable properties, known as explanatory variables or features. These properties may be categorical, ordinal, integer-valued, real-valued, etc. Other classifiers perform a class assignment by comparing current observations to previous observations by means of a similarity or distance function.

A classifier can be parametric or non-parametric depending on the type of model adopted for the observations.

Classification algorithms include those:

- based on the distance between a decision surface and training patterns, e.g. support vector machines [SVM];
- based on the distance between the pattern to be recognised and some reference, where the reference can be a prototype, a centroid of samples of the same class or the closest patterns from the same class or different classes, e.g. nearest-neighbour classification;
- based on a parametric, probabilistic model, where the model uses the Neyman-Pearson lemma, likelihood ratios, Receiver Operating Characteristics [ROC], plotting the False Acceptance Rate [FAR] versus the False Rejection Rate [FRR], Bayesian classification, etc.;
- based on a graph-like or tree-like model, e.g. decision trees, random forests, etc. Examples are the Classification and Regression Trees [CART], ID3 [Iterative Dichotomiser 3], C4.5, etc.

When the decision surface of the classifier is considered, this can be a linear classifier or non-linear classifier. Linear classifiers model the boundaries between different classes in the feature space as hyperplanes. Non-linear classifiers use e.g. quadratic, polynomial, or hyperbolic functions instead.

CART	Classification and Regression Tree
C4.5	Classification algorithm using a decision tree
FAR	False Acceptance Rate
FRR	False Rejection Rate
Gini impurity	A measure of how often a randomly chosen element from the set would be incorrectly labeled if it was randomly labeled according to the distribution of labels in the subset; usually used at the level of the nodes of tree-based classifiers.
ID3	Iterative Dichotomiser 3, a precursor of C4.5
ROC	Receiver Operating Characteristics

# G06F 18/25

# **Fusion techniques**

## **Definition statement**

This place covers:

Combining the information from several sources in order to form a unified data representation.

A simple fusion process combines raw data from several sources or different modalities (e.g. fusing spatial and temporal data). Besides fusing the raw data, it is also possible to first process the sensor data to extract features and then combine the extracted features into a joint feature vector. Alternatively, it is possible to fuse classification results, e.g. inputting the features from different sensor modalities to separate classifiers, receiving respective classification scores from each classifier, and combining the individual scores into a final classification result.

Examples are probabilistic fusion, statistic fusion, fuzzy reasoning fusion, fusion based on evidence and belief theory, e.g. Dempster-Shafer or fusion by voting.

Fusion can also be applied at different stages of a recognition system for different purposes, e.g. for dimensionality reduction, computing robustness, improving precision and certainty in the classification decisions, etc.

Dempster-Shafer	General framework for reasoning with uncertainty which combines
	evidence from different sources and arrives at a degree of belief
	(represented by a mathematical object called belief function) that
	takes into account all the available evidence.

## G06F 18/27

# Regression, e.g. linear or logistic regression

#### **Definition statement**

This place covers:

Pattern recognition techniques based on regression, i.e. statistical techniques for estimating the relationships between a dependent variable (often called the "outcome" or "response" variable) and one or more independent variables (often called "predictors", "covariates" or "explanatory variables"), where the variables model the underlying data.

## Common forms of regression are:

- Linear regression the model specification is that the dependent variables are a linear combination of the parameters (but need not be linear in the independent variables). The goal is to find a line (or a more complex linear combination) that most closely fits the data according to a specific mathematical criterion (e.g. by minimising the least-mean-squares criterion). For example, the method of ordinary least squares computes the unique line (or hyperplane) that minimises the sum of squared differences between the true data and that line (or hyperplane);
- Non-linear regression, e.g. polynomial, binomial, binary, logistic, multinomial logistic, etc.

# Security arrangements for protecting computers, components thereof, programs or data against unauthorised activity

# **Definition statement**

This place covers:

Security arrangements for protecting computers or their components, programs and data against unauthorised activity, e.g. intrusion into a computer, computer malware detection and handling, authentication, unauthorised use of data, dishonest alteration of data, theft of secret data.

In particular, the following subjects are covered:

- Protecting specific internal or peripheral components in which the protection of a component leads to protection of the entire computer;
- Monitoring users, programs or devices to maintain the integrity of platforms;
- · Authenticating users, programs or devices;
- Protecting distributed programs or content, e.g. vending or licensing of copyright material;
- Protecting data used within a computer.

# Relationships with other classification places

This group covers security arrangements for local platforms.

Classification should be directed to groups  $\underline{\text{H04L 9/00}}$  -  $\underline{\text{H04L 9/32}}$  when the subject is secret or secure communication involving the use of encryption.

Furthermore, classification should be directed to group when cryptographic protocols are of relevance <u>H04L 9/00</u>, <u>H04L 63/00</u> when network security protocols are of relevance, <u>H04L 65/60</u> when Media handling, encoding, streaming or conversion are of relevance, <u>H04L 67/01</u> when network protocols for data switching network services are of relevance.

Finally, classification should be directed to group <u>H04W 12/00</u> when security or authentication arrangements in wireless communication networks are of relevance.

# Special rules of classification

The general rule is to limit to the best-suited group but there could be a plurality of groups for a document if that document discloses many relevant aspects when taken separately (e.g. a document having isolated disclosures) or in combination, in particular when a combination of groups is more suited to reflect the disclosure.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Content	means any intellectually created work whose copyright is to be
	safeguarded

# G06F 21/10

Protecting distributed programs or content, e.g. vending or licensing of copyrighted material (protection in video systems or pay television H04N 7/16) {; Digital rights management [DRM]}

#### **Definition statement**

This place covers:

Protecting software against unauthorised usage in a vending or licensing environment, e.g. protecting the software provider's copyright. The protection is generic, i.e. not specific to the type of content.

Protecting data in an environment substantially outside the data owner's control (or in a hostile environment). The term "hostile environment" means data and operational environment of the data are controlled by different entities.

Example: hostile environment: Financial Times [FT] has a server where users who pay get a key that enables locally stored encrypted FT-newspaper-articles to be decrypted and read. The articles are in a hostile environment, the computer of the user, where FT has limited or no influence, therefore the article needs to be protected from the user, in this case by encryption.

# {by binding digital rights to specific entities}

# **Definition statement**

This place covers:

Different protection for each instance of software or content, e.g. creating hardware or user specific versions, binding software or content to specific terminals or devices.

# G06F 21/1011

# {to devices}

## **Definition statement**

This place covers:

Binding licenses to one rendering device the user uses, e.g. mp3-player, computer or mobile phone.

# G06F 21/1012

# {to domains}

# **Definition statement**

This place covers:

Binding licenses to a group or type of rendering devices the user uses, e.g. list, type or capabilities of devices, something the device belongs to.

# G06F 21/1013

# {to locations}

# **Definition statement**

This place covers:

Binding licenses to a location.

# G06F 21/1014

# {to tokens}

## **Definition statement**

This place covers:

Binding licenses to something the user possesses, e.g. tokens, mobile phones, recording media or USB-sticks. The content can be transferred from one device to another.

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Token	not rendering the content

# G06F 21/1015

# {to users}

## **Definition statement**

This place covers:

Binding the content to a user.

Binding licenses to characteristics of the user, e.g. biometrics, fingerprint, iris or behaviour.

Binding licenses to a group the user belongs to, e.g. domain, family, friends, university, library or company.

Binding licenses to something the user knows, e.g. a password.

## G06F 21/105

# {Arrangements for software license management or administration, e.g. for managing licenses at corporate level}

#### **Definition statement**

This place covers:

Examples: Managing floating licenses to protect against unauthorized usage of distributed programs or content.

# G06F 21/1062

# {Editing}

#### **Definition statement**

This place covers:

Editing or modifying the content by the user.

Modifying or creating licenses for e.g. re-distributing rights, adjustment to user-needs, license changes, also including shareware where the license is updated.

#### References

# Informative references

Personalisation of content	G06F 21/1063
Superdistribution of content	G06F 21/1086

# {Personalisation}

## **Definition statement**

This place covers:

Converting content for different system requirements, e.g. different digital right management systems, less powerful devices, interoperability or compatibility.

User defined content, specifically created on user or business request.

Watermark identifying e.g. content, user or device.

Same copy for demo version or product version.

# G06F 21/1064

# {Restricting content processing at operating system level}

# **Definition statement**

This place covers:

Usage restrictions implemented at operating system level to prevent e.g. access to registers, clipboard or APIs.

# G06F 21/1066

# {Hiding content}

## **Definition statement**

This place covers:

Hiding content, licenses or keys, e.g. inside the content, file systems, at operating system level or by obfuscating.

# G06F 21/107

# {License processing; Key processing}

## **Definition statement**

This place covers:

Techniques of key generation specifically designed for digital right management implementation.

Techniques of key distribution specifically designed for digital right management implementation.

## References

# Informative references

Key distribution or management, e.g. generation, sharing or updating, of	H04L 9/08
cryptographic keys or passwords	

# {Conversion}

## **Definition statement**

This place covers:

Converting a license for e.g. different digital right management systems, languages, versions, user needs, less powerful devices, interoperability or compatibility.

Grace period, e.g. in offline systems the user should be able to continue for some time even if a license is expired.

Definition of rights, e.g. rights definition languages, grammar, syntax, semantics, graphical representations of rights, parsers or right consistency.

# G06F 21/1076

# {Revocation}

# **Definition statement**

This place covers:

Methods for revoking licenses, e.g. preventing licenses to be restored again from backup or looking after copies of the license to delete all instances of the license.

# G06F 21/1077

# {Recurrent authorisation}

## **Definition statement**

This place covers:

Performing recurrent authorisation checks, not just at installation or loading time.

# G06F 21/1078

# {Logging; Metering}

# **Definition statement**

This place covers:

Logging, metering or counting, e.g. copy, usage, play, transfer, move, delete, modification or time.

Note:

License logging also falls under this definition, because for logging a license is considered as content.

# G06F 21/1079

## {Return}

# **Definition statement**

This place covers:

The content or license is given back from the user or client, e.g. for floating licenses, check-in/check-out, or renting.

## References

Time stamp	G06F 2221/2151

## Special rules of classification

The difference between  $\underline{G06F}$  21/56+ and the others groups  $\underline{G06F}$  21/50+ (namely  $\underline{G06F}$  21/51,  $\underline{G06F}$  21/52+,  $\underline{G06F}$  21/55+ and  $\underline{G06F}$  21/57+) may be formulated as:

- G06F 21/56+: we would trust the code or system if it were not infected (we look for the infection as such)
- other groups G06F 21/50+ (see definition above): we don't trust the code or system (we make an assessment of the global code or system; we don't look for an infection as such) G06F 2221/031 (Protect user input by software means) and G06F 2221/032 (Protect user output by software means) are additionally used to distinguish documents dealing with securing user input/output, e.g. in banking systems / applications

The subclasses G06F 2221/03+ are used in combination with this group.

# G06F 21/51

at application loading time, e.g. accepting, rejecting, starting or inhibiting executable software based on integrity or source reliability

## **Definition statement**

This place covers:

Accept / reject loading of application:

- · onto platform for later execution.
- into memory for immediate execution.

#### from

- Loal storage
- Remove device (e.g. By downloading).

Based on static features of the application when not being executed e.g.:

- Signature or certificate provided by application creator, provider or tester
- Integrity.
- · Capability list.
- capabilities of application determined by analysis.

An application is software distinct from firmware and os such as:

- Directly executable code (binary code)
- Interpretable programs (script language)
- Interpretable files such as html, word, etc. Documents

#### Examples:

- Verify integrity or application origin (application creator, provider, or tester) by checking a signature, certificate, etc. of application.
- Verify integrity of application or application origin by transforming and reverse transforming the application:By analyzing user content, e.g. analyse relationship of websites referred to by a web page.
- · Check application capabilities versus a predefined security policy.

Monitoring of the whole system running many programs	G06F 21/55

## G06F 21/53

# by executing in a restricted environment, e.g. sandbox or secure virtual machine

# **Definition statement**

This place covers:

Intrusion detection at the environment level of the execution of the single program e.g.:

- Run program in secure, isolated environment (VM, sandbox), e.g. by modifying VM or sandbox to include special security measures
- Provide security measures in interface (library, API, OS) of program with its Environment, e.g.:
- · Provide secure library or API interfacing the program
- · Modify library, API or OS to include security measures
- Have OS service or library making security checks or running in protected environment

Examples: by using virtual machine, sandbox, secure library or by isolating processes at operating system level

# G06F 21/54

# by adding security routines or objects to programs

# **Definition statement**

This place covers:

- Transformation by addition of code to Source code
- Executable program to be loaded or already loaded in memory for execution to ensure proper execution of program
- Examples:
- · Add / modify code to detect fault injection by enforcing proper execution sequence
- · Modify code to detect improper execution flow when code error
- · Add code to detect software attacks
- · Modify code to enforce security policy
- Add code to detect code tampering in memory
- · Add dummy instructions for obfuscation purposes

monitoring	

# G06F 21/556

{involving covert channels, i.e. data leakage between processes (inhibiting the analysis of circuitry or operation with measures against power attack G06F 21/755)}

#### **Definition statement**

This place covers:

A covert channel is defined as being a communication channel that allows a process to transfer information in a manner that violates the system's security policy.

E.g.: software measures against:

- Intended malevolent internal signalling or communication between processes on system.
- Intended malevolent external signalling or communication by process on system.
- Accidental internal leakage of data between processes on system by storage or communication
- · Accidental external leakage of data of process on system by storage or communication
- · Accidental internal or external leakage of system or process state or behaviour

# Examples:

- Protect against physical (e.g. electromagnetic; non power consumption) monitoring to obtain information on data manipulated by the system or code executed by the system.
- Protect against fault attacks
- Data leakage between processes via common / non secure memory Secure data transfer within processes
- · Hidden communication between processes by one process observing other process behaviour
- External data leakage by hidden communication
- · Unwanted data leakage in programs
- Modify code to avoid information exposure in memory

# Special rules of classification

- The difference between <u>G06F 21/56</u> and the others subgroups under <u>G06F 21/50</u> (namely <u>G06F 21/51</u>, <u>G06F 21/52</u>, <u>G06F 21/55</u> and <u>G06F 21/57</u>) may be formulated as:
- G06F 21/56: we would trust the code or system if it were not infected (we look for the infection as such).
- Other groups under G06F 21/50 (see definition above): we don't trust the code or system (we make an assessment of the global code or system; we don't look for an infection as such).

# Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Virus	A malicious (i.e. intended to harm) executable code or script	
	hidden or embedded in a normally non malicious data, code or	
	system. It need not be self-replicating	

# G06F 21/561

# {Virus type analysis}

## **Definition statement**

This place covers:

Information relating to a specific type or family of viruses.

# G06F 21/562

# **{Static detection}**

## **Definition statement**

This place covers:

Detect presence of virus without executing directly or by emulation, except emulation for the purpose of higher level analysis (control code, data flow)

Examples of such detections:

- Analyse source code or scripts.
- Execute intermediate compiled code and analyse.
- · Compile and analyse.
- Disassemble binary code and analyse control flow or data flow and/or match execution code patterns without simulation of execution.
- · Validate file formats.
- · Verify based on file type.

# G06F 21/563

# {by source code analysis}

# **Definition statement**

This place covers:

Starting point for analysis: source code, script or file type or format. The source code may be obtained by disassembly.

# G06F 21/60

# **Protecting data**

## **Definition statement**

This place covers:

Authorizing access to an executable program using techniques specific to executable programs (e.g. manipulation of the code, manipulation of the instruction flow or data flow, security routine in the program to verify a code in a dongle) Protecting data in an environment substantially within the data owner's control (or in a non-hostile environment). The term "hostile environment" means data and operational environment of the data are controlled by different entities.

Example: non-hostile environment: FT(Financial Times) has a server where users who pay get a username+password to access FT-newspaper-articles on the server. FT has full control over the server, the data is stored on the server, and therefore the data is not in a hostile environment.

Simulation for teaching or training purposes	G09B 9/00
Arrangements for designing of test circuits for static stores	G11C 29/54

# **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Description of technical parameters or a virtual model of a technical arrangement; does not cover aesthetic aspects; not to be confused with the physical object.
Determining the correct functioning of a design; not to be confused with testing of a physical object.

Glossary of terms

Simulation	Determining technical properties and behaviour of an entity by performing a virtual simulation of a model in a computer, possibly by using specifically adapted hardware.
	A computer readable description of an entity, defining or implying technical properties.

# G06F 30/10

## **Geometric CAD**

#### **Definition statement**

This place covers:

- Design of geometrical structures of technical entities, e. g. shape, dimensions, etc., using CAD
- Simulation for the design thereof

### G06F 30/36

# Circuit design at the analogue level

#### **Definition statement**

This place covers:

CAD tools working at the analogue level.

Note:

The nature of the designed circuit (e.g. a digital circuit) is not decisive: if the CAD tool operates over continuous values (e.g. current, voltage, frequency), the subject-matter is to be classified here.

# G06F 30/39

# Circuit design at the physical level (physical level design for reconfigurable circuits G06F 30/347)

#### **Definition statement**

This place covers:

CAD tools operating over the physical parameters (geometry, routing, and sizing) of the circuit, considering the electrical characteristics of said circuit.

#### References

## Limiting references

### G06F 30/392

# Floor-planning or layout, e.g. partitioning or placement

#### **Definition statement**

This place covers:

CAD tools for use during the floorplanning design stage of a circuit.

Note: The term "floorplan" is used here in the context of circuit design with its generally accepted meaning and covers an early stage in the hierarchical approach to integrated circuit design regarding optimally placing a given set of circuit modules.

Floorplanning covers taking in some of the geometrical constraints in a design such as

- bonding pads for off-chip connections
- line drivers which often have to be located as close to bonding pads as possible

**Definition statement** 

- minimum chip area needed to fit in the required number of pads; predetermined area blocks such as intellectual property blocks (IP-blocks)
- limitations such as permitting no routing of signals directly above an IP block

Floorplan optimisation subject to various constraints and requirements of optimisation, e.g. block areas, aspect ratios, estimated total measure of interconnects, etc.

## **Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

IP block, IP core	The terms IP block and IP core are used as synonyms and relate to reusable unit of logic, cell, or integrated circuit (commonly called a "chip") layout design that is the intellectual property of one party.
	The term is derived from the licensing of the patent and/or source code copyright that exist in the design. IP cores can be used as building blocks within application-specific integrated circuit (ASIC) designs or field-programmable gate array (FPGA) logic designs during the floorplanning design stage of a circuit.

## G06F 40/00

# Handling natural language data (speech analysis or synthesis, speech recognition G10L)

## **Definition statement**

This place covers:

- · Text and natural language processing,
- Natural language understanding and translation,
- · Processing of markup language,
- · Spreadsheets.

## Relationships with other classification places

The mere use of XML or other markup language, e.g. as a file format for functional data such as configuration files, should not be classified here, but rather in the field in which the data is actually used.
