

G09G

ARRANGEMENTS OR CIRCUITS FOR CONTROL OF INDICATING DEVICES USING STATIC MEANS TO PRESENT VARIABLE INFORMATION (arrangements for transferring data between digital computers and displays [G06F 3/14](#); static indicating arrangements comprising an association of a number of separate sources or light control cells [G09F 9/00](#); static indicating arrangements comprising integral associations of a number of light sources [H01J](#), [H01K](#), [H01L](#), [H05B 33/12](#); scanning, transmission or reproduction of documents or the like, e.g. facsimile transmission, details thereof [H04N 1/00](#))

Definition statement

This place covers:

- Arrangements or circuits for processing control signals to achieve the display, e.g. for the reception, storage, regeneration, coding, decoding, format manipulation, addressing of control signals.
- Solution of problems of displays by means of their control, i.e. control for which features of a display are relevant, e.g. to compensate for varying pixel behaviour, which may lead to non-uniformity in the display.
- Improvements of the control of displays, i.e. where the functionality of controlling a display is relevant, e.g. selective brightness adaptation for lowering energy consumption of the display, possibly after image analysis.
- The visual effect in the indicating means using the static means may be produced by the generation of an image on a screen, e.g. indirectly by scanning an electron beam onto a luminescent screen, directly by controlled light sources, by projection of light from controlled light sources or light modulators onto characters, symbols, or elements thereof drawn on a support, or by electric, magnetic, or mechanic control of the parameters of light rays from an independent source.

Relationships with other classification places

Subclass [G09G](#) covers electronic control of display characterised by the display device itself, whereas it does not cover:

- electronic control characterized by the pictorial communication, e.g. television, which is covered by subclass [H04N](#), or
- aspects like rastering an image onto the target resolution by a raster image processor (RIP), or image enhancement aspects like augmented reality, which are covered by subclass [G06T](#).

Subclass [G09G](#) does not cover software modules, e.g. software driver modules for the display, or their interaction, such as interaction between software modules related to the display of windows or interaction between a software driver module for the display and the operating system which are covered by group [G06F 9/00](#).

Instruments specially adapted for vehicles; Arrangement of instruments in or on vehicles	B60K 35/00
Equipment for fitting in or to aircraft	B64D
Combined instruments indicating more than one navigational value, e.g. for aircraft	G01C 23/00
Cathode-ray oscilloscopes	G01R 13/20
Optical scanning systems	G02B 26/10
Image data processing or generation, in general	G06T
Digital stores in which the information is moved stepwise, e.g. shift registers	G11C 19/00

Special rules of classification

The Indexing Codes in this subclass are to be used for classifying additional information relevant for the invention.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

indicating device	display device
static means to display information	means not using movement of macroscopic parts for information build-up, e.g. displays using LCDs, LEDs, DMDs, ... for image build-up
to present	to display
variable information	information with variable content

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

CRT	Cathode Ray Tube
LCD	Liquid Crystal Display

AC-PDP	Alternate Current Plasma Display Panel
DC-PDP	Direct Current Plasma Display Panel
LED	Light Emitting Diode
OLED	Organic Light Emitting Diode
DMD	Digital Micromirror Device
MEMS	Microelectromechanical systems

G09G 1/00

Control arrangements or circuits, of interest only in connection with cathode-ray tube indicators; {General aspects or details, e.g. selection emphasis on particular characters, dashed line or dotted line generation; Preprocessing of data} (cathode-ray oscilloscopes [G01R 13/20](#); {radar display arrangements [G01S 7/04](#); display of digital non-picture data in television systems [H04N 7/0255](#)})

Definition statement

This place covers:

- Control arrangements or circuits, of interest only in connection with cathode-ray tube indicators;
- General aspects or details, e.g. selection emphasis on particular characters, dashed line or dotted line generation;
- Preprocessing of data therefor.

References

Limiting references

This place does not cover:

Adaptations for aircraft instruments	B64D 43/00
Aircraft flight instrument display	G01C 23/005

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Display terminal	Means an apparatus connected to a source of display data (usually a graphics controller of a computer, or directly to the computer itself) adapted to display images generated by this source of data. In general a "Display terminal" is an arrangement including a display device (e.g. a CRT with its driving electronic or a flat panel including its row and column drivers), a display device controller (the hardware and software (usually a microprocessor) that controls the display device and that allows its functioning by, for example, generating the signals that are needed to bring the data to the drivers) and a display terminal controller (the hardware and software used to control the display terminal as a whole and to interface the display terminal to the graphics controller, to adapt data and control signals, for example in an LCD driven by a VGA type graphics controller).

G09G 1/167

{Details of the interface to the display terminal specific for a CRT (details suitable for both CRT and flat panel [G09G 5/006](#), specific for a flat panel [G09G 3/2096](#))}

Definition statement

This place covers:

Illustrative examples: Parallel data display of multiple executing environments:US2004226041.

Single horizontal scan range CRT monitor: WO0129811.

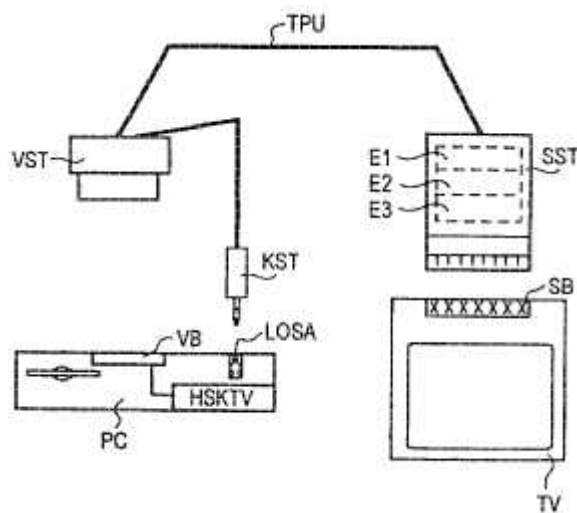

Improved signal restoration: US6529248.

Display monitor control and communications bus interface: US6590572.

TV-PC conversion cable. DE19630941.

Adding display data channel to existing display: GB2294135.

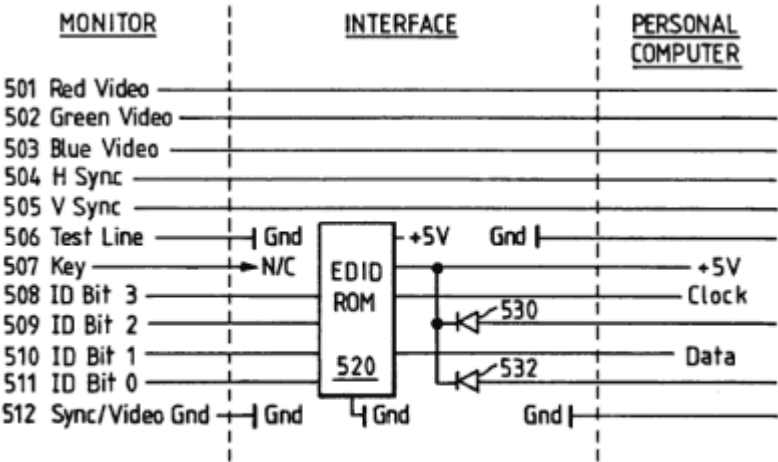

FIG. 6

Separate message section on CRT display device: US5384576.

References

Limiting references

This place does not cover:

Specific for a flat panel	G09G 3/2096
Suitable for both CRT and flat panel	G09G 5/006
Control arrangements or circuits for visual indicators common to cathode-ray tube indicators and other visual indicators, Details of the interface to a display terminal	G09G 5/006

Informative references

Interfacing with colour display	G09G 1/285
Control of matrices with row and column drivers	G09G 3/3611
Using display panels	G06F 3/147
Using cathode-ray tubes	G06F 3/153

Special rules of classification

The class [G09G 1/167](#) includes "details of the interface to a CRT display terminal". If a television set is used as a display terminal, the class [G09G 5/006](#) should be given and not the [G09G 1/167](#). This is because the signals generated for a television set are standard television signals (NTSC or PAL...): the television itself might have an lcd or plasma panel. If the interface to the display terminal has some details about the signals of the interface, and if these details are clearly means for a CRT terminal (e.g. level or polarity of a h-synch or v-synch signals, black level adjustment...) then the documents are classified in the [G09G 1/167](#).

G09G 1/18

a small local pattern covering only a single character, and stepping to a position for the following character, e.g. in rectangular or polar co-ordinates, or in the form of a framed star

Definition statement

This place covers:

Illustrative example of subject matter classified in this group (US3777059):

G09G 1/20

using multi-beam tubes ([G09G 1/26](#), [G09G 1/28](#) take precedence)

Definition statement

This place covers:

Multiple beams and beam deflection necessary! A flat panel using deflection is considered as being a multiple beam CRT.

Illustrative examples:

Common focus: US5382883.

US4063233

Separated regions: EP1054379, DE1137143.

For intensity control: US5691608,

FR2296228.

G09G 1/285

{Interfacing with colour displays, e.g. TV receiver}

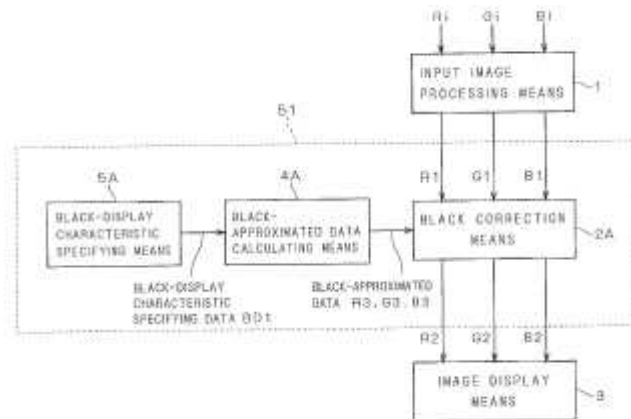

Definition statement

This place covers:

- specific interface circuits between the color processing output circuit (e.g. output of video ram or color lookup table if present) and the color display tube;
- fiber-optic data link between color control circuit and CRT-monitor;
- color normalisation for display terminals: e.g. adapting the LUT content to the specific colors of the phosphors and to the gamma curve of the display;
- monitor sensing circuits (color \Leftrightarrow monochrome).

Illustrative examples:

Display device with black correction unit: US2002150293.

Compensation method for improving color saturation and image quality of plasma display panel by adjusting the strength of input image signals: US2002167467.

Plasma displays

Method and apparatus for automatically calibrating a CRT: EP0539943.

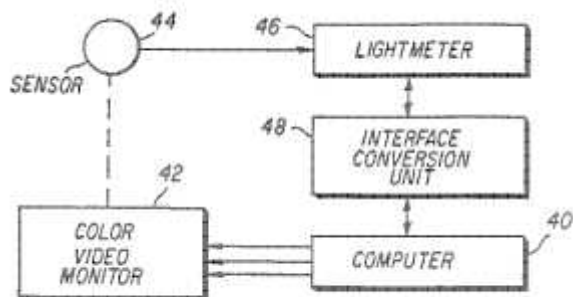

FIG. 3

Definition statement

Image display system that performs grayscale correction in accordance with the on-site environment:
US2003147053.

Light output correction of a display monitor. EP0514025.

Multi-spectral color correction. US2002122044.

G09G 3/00

Control arrangements or circuits, of interest only in connection with visual indicators other than cathode-ray tubes

Definition statement

This place covers:

- Control of flat panel display in general.

Definition statement

- Control of rotatable displays: to display information on a screen in either a horizontal orientation (landscape) or vertical orientation (portrait) the display controller is able to change the orientation of the displayed information. In some cases the physical screen is also rotated.

G09G 3/001

{using specific devices not provided for in groups [G09G 3/02](#) - [G09G 3/36](#), e.g. using an intermediate record carrier such as a film slide; Projection systems; Display of non-alphanumerical information, solely or in combination with alphanumerical information, e.g. digital display on projected diapositive as background (slide projectors per se [G03B 23/00](#) = 42 HP)}

Definition statement

This place covers:

- Using an intermediate record carrier such as a film slide.
- Control of projection systems or displays.
- Display of non-alphanumerical information, solely or in combination with alphanumerical information, e.g. digital display on projected diapositive as background.
- Control of rotating or moving display (Roled): one or more (usually linear) arrays of light emitting elements are rotated or moved to display an image on a virtual screen created on the surface of revolution or movement.
- Control of stereoscopic computer displays.
- Control of multiple view displays, i.e. displays producing e.g. two images which are visible under different viewing angles.

Illustrative examples of subject matter classified in this place:

1.

Figure 1 illustrates a display device with rotating display elements.

2.

Figure 2 illustrates a high-speed link for rotating display.

3.

Figure 3 illustrates a projector with image modified to compensate distortions from projecting onto a screen from a side, so called "Keystone correction".

Definition statement

4.

Figure 4 illustrates a coloured display which displays two different images depending on the viewing direction.

5a.

5b.

Figures 5a and 5b illustrate an image display apparatus.

6.

Figure 6 illustrates a baton using light emitting cell array to form a display.

7.

G09G 3/004

{to give the appearance of moving signs}

Definition statement

This place covers:

Display devices wherein, different from a standard panel:

- the displayed image has a higher resolution than the display device itself; and
- at any time, only part of the complete image is displayed.

Illustrative example: EP0709818

G09G 3/006

{Electronic inspection or testing of displays and display drivers, e.g. of LED or LCD displays (testing individual LED's [G01R 31/2635](#); testing lamps [G01R 31/44](#); testing of optical features of LCD displays [G02F 1/1309](#))}

Definition statement

This place covers:

Testing or inspecting flat panel displays by electrical means, i.e. by checking electrical signals and parameters while driving the panel, possibly under special driving conditions specific for the test.

References

Limiting references

This place does not cover:

Testing of individual LEDs	G01R 31/2635
Testing lamps	G01R 31/44

Testing of optical features of LCD displays	G02F 1/1309
---	-----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Investigating or analysing materials by the use of optical means, i.e. using infrared, visible, or ultraviolet light; etc. Inspecting patterns on the surface of objects.	G01N 21/956
Testing of electronic circuits	G01R 31/282
Diagnosis, testing or measuring for television systems or their details	H04N 17/00

Special rules of classification

Does not apply to testing during manufacturing of non-finished flat panel displays, when the result of the testing are used to determine parameters of the subsequent manufacturing steps (such testing is regarded as a step of manufacturing).

Also, does not apply if the testing/inspecting is carried out by optical means (e.g. optical measurements), which is classified in [G01R](#). In some "mixed" or doubtful cases classifications in both [G09G 3/006](#) and [G01R](#) may be given.

Does not apply to mere calibration of display devices, i.e. to the setting of control parameters for properly functioning displays based on detection of operation parameters (e.g. detection of colour, luminance etc), for which Indexing Code [G09G 2320/0693](#) applies.

G09G 3/02

by tracing or scanning a light beam on a screen

Definition statement

This place covers:

- Control of displays using a deflected and modulated light beam for directly producing the displayed image on the screen.
- Control of displays using deflected and modulated light beams, which are generated by a linear array, for directly producing the displayed image on the screen.
- Control of displays using a deflected and modulated light beam to control an array of photosensitive elements that receive it and consequently command each a pixel display element.
- Control of displays using a deflected and modulated light beam for optically writing image data on a photosensitive surface that commands a display such as a light modulator.
- Control of stereoscopic displays.
- Control of multiple view displays, i.e. displays producing e.g. two images which are visible under different viewing angles.

Illustrative examples:

US3739370 (deflected light beam producing the displayed image on the screen)

Definition statement

US4097115 (Control of optical scanning device for producing a multiple line scan using a linear array of sources and a textured scanned surface)

US2006132452 (control of a display using a deflected and modulated light beam to control an array of photosensitive elements that receive it and consequently command each a pixel display element)

G09G 3/20

for presentation of an assembly of a number of characters, e.g. a page, by composing the assembly by combination of individual elements arranged in a matrix {no fixed position being assigned to or needed to be assigned to the individual characters or partial characters}

Definition statement

This place covers:

- Control of displays having display elements arranged in a matrix with details of two or more display technology, but aspects of general character for various, if not all display technologies.
- Control of displays having display elements arranged in a matrix without specifying a display technology.

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Electronic inspection or testing of displays and display drivers	G09G 3/006
Control arrangements or circuits for presentation of a single character by selection from a plurality of characters, or by composing the character by combination of individual elements, e.g. segments	G09G 3/04

Special rules of classification

For control arrangements or circuits with details concerning the control of intermediate tones of elements arranged in a matrix, a code within [G09G 3/2007](#) is to be given, and with details concerning the colour, [G09G 3/2003](#) is to be given. For control arrangements or circuits for elements arranged in a matrix with details of one specific display technology, a code corresponding to the specific display technology is to be given, e.g. [G09G 3/38](#) for using electrochromic elements.

G09G 3/2003

{Display of colours (specific for liquid crystal displays [G09G 3/3607](#))}

Definition statement

This place covers:

Control of a display to display a coloured image with aspects specific for flat panel displays.

References

Limiting references

This place does not cover:

Control of a liquid crystal display for displaying a coloured image	G09G 3/3607
---	-----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Control of a display for displaying a coloured image in general	G09G 5/02
---	---------------------------

G09G 3/2007**{Display of intermediate tones}****Definition statement***This place covers:*

Control of a display to display an image having intermediate tones with aspects specific for flat panel displays.

Special rules of classification

Does not apply to a control of the brightness of a display as a whole, for which the Indexing Code [G09G 2320/0626](#) should be given.

G09G 3/2011**{by amplitude modulation}****Definition statement***This place covers:*

Control of a display to display an image having intermediate tones by modulating the amplitude of the analog signals applied to the display elements.

Special rules of classification

This code is only given if specific details of the amplitude modulation are present or the amplitude modulation plays a significant role, but not for indicating the presence of a usual amplitude modulation in a document.

G09G 3/2014**{by modulation of the duration of a single pulse during which the logic level remains constant}****Definition statement***This place covers:*

Control of a display to display an image having intermediate tones by modulating the duration of a single pulse applied to the display element or by modulating the duration of several pulses applied to the display element in the same manner.

Illustrative examples:

Definition statement

US2003/0117420 (modulation of the intermediate tone displayed by a pixel by varying the width applied to a data electrode during a scan period determined by the scan signal applied to the scan electrode)

**G09G 3/2018**

{by time modulation using two or more time intervals}

Definition statement

This place covers:

- Control of a display to display an image having intermediate tones by frame rate control or temporal dithering, i.e. the intermediate tone is generated by selectively activating a display element in a number of frames.
- Control of a display to display an image having intermediate tones by modulating the duration of several pulses applied to the display element in a different manner for each pulse.

G09G 3/2022

{using sub-frames}

Definition statement

This place covers:

- Control of a display to display an image having intermediate tones by using sub-frames, i.e. selectively activating a display element in a number of non-overlapping time periods, in which a frame is subdivided.
- Control of a display to display an image having intermediate tones by using sub-frames, i.e. selectively activating a display element in a number of non-overlapping time periods, in which a frame is subdivided, wherein no details of the ratios of the duration of one sub-frame to the duration of another sub-frame are given.
- Control of a display to display an image having intermediate tones by using sub-frames, i.e. selectively activating a display element in a number of non-overlapping time periods, in which a

Definition statement

frame is subdivided, wherein the durations of the sub-frames are binary numbers, i.e. the duration of the second shortest sub-frame is twice the duration of the shortest sub-frame, the third shortest sub-frame is four times the duration of the shortest sub-frame, ..., and the duration of the n th shortest sub-frame is $(n-1)$ times the duration of the shortest sub-frame.

Special rules of classification

For plasma display panels, this code is only to be given if specific details of the generation of intermediate tones using sub-frames are present or the generation of intermediate tones using sub-frames plays a significant role, but not for indicating the presence of a usual generation of intermediate tones using sub-frames in a document.

G09G 3/2025

{the sub-frames having all the same time duration}

Definition statement

This place covers:

Control of a display to display an image having intermediate tones by using sub-frames having all the same duration, i.e. a frame rate control with the intermediate tone being generated by selectively activating a display element in a number of sub-frames.

G09G 3/2029

{the sub-frames having non-binary weights}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using sub-frames, wherein the durations of the sub-frames are not all binary numbers, i.e. at least for one sub-frame it does not hold that the duration of the n th shortest sub-frame is $(n-1)$ times the duration of the shortest sub-frame.

Special rules of classification

This code is not given if for all the sub-frames the ratio of the duration of one sub-frame to the duration of another sub-frame is a binary number, but one or more of the sub-frames are split in two or more time periods, wherein the time periods are still addressed by the same binary bit.

Illustrative examples:

GB2327798 (ratio of the durations of the display period of the fourth shortest sub-frame and the shortest sub-frame is seven, not eight)

G09G 3/2033

{with splitting one or more sub-frames corresponding to the most significant bits into two or more sub-frames}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using sub-frames, wherein one or more sub-frames corresponding to the most significant bits are split into two or more time periods, which are still addressed by the same bit.

Special rules of classification

This code is not given if the sub-frame corresponding to the most significant bit is not split, but only other sub-frames corresponding to lower bits are split. This code is also not given if the time periods, into which the sub-frames corresponding to the most significant bits are split, are individually addressed by separate bits, but the code [G09G 3/2029](#) might apply.

Illustrative examples:

EP0774745 (sub-frame with the longest duration and corresponding to the most significant bit is split in two periods controlled by the same most significant bit)

**G09G 3/2037**

{with specific control of sub-frames corresponding to the least significant bits}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using sub-frames, wherein one or more sub-frames corresponding to the least significant bits are specifically controlled to increase the number of intermediate tones without applying to narrow pulses.

Special rules of classification

This code is not given if the sub-frame corresponding to the least significant bit is not specifically controlled, but only other sub-frames corresponding to higher bits.

Illustrative examples:

US5751379 (sub-frame with the shortest duration and corresponding to the least significant bit is displayed only every second frame)

G09G 3/204

{the sub-frames being organized in consecutive sub-frame groups}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using sub-frames, wherein the sub-frames are organized in consecutive sub-frame groups, e.g. the groups being separated by a pause period, or the sub-frames within one group having a common addressing scheme, or a specific order with respect to the size of the corresponding bits.

Illustrative examples:

EP1710777 (sub-frames of one frame are arranged in two groups divided by an idle period and with increasing durations within each group)

G09G 3/2044

{using dithering}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using dithering, i.e. by adding a noise signal to the image signal or the gradation threshold.

References

Limiting references

This place does not cover:

Control of a display to display an image having intermediate tones by frame rate control or temporal dithering, i.e. the intermediate tone is generated by selectively activating a display element in a number of frames	G09G 3/2018
Control of a display for displaying an image having intermediate tones by using error diffusion, i.e. distributing the quantization error to neighbouring display elements	G09G 3/2059

This place covers:

Control of a display for displaying an image having intermediate tones by using dithering, wherein the noise signal added to the image signal or the gradation threshold is random noise.

G09G 3/2051

{with use of a spatial dither pattern}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using dithering, wherein the noise signal added to the image signal or the gradation threshold is a spatial dither pattern applied to the display element and its neighbouring display elements.

G09G 3/2055

{the pattern being varied in time}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using dithering, wherein the noise signal added to the image signal or the gradation threshold is a spatial dither pattern applied to the display element and its neighbouring display elements, and the spatial dither pattern is varied in time, e.g. from one frame to the next frame, and cyclically, i.e. the same pattern is reused after a certain time period.

G09G 3/2059

{using error diffusion}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using error diffusion in space, i.e. distributing the quantization error to neighbouring display elements.

Definition statement

Illustrative examples:

EP1587053 (error diffusion in space; sections 0027, 0028).

G09G 3/2062

{using error diffusion in time}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using error diffusion in time, i.e. distributing the quantization error to the next frame.

Illustrative examples:

EP1583063 (error diffusion in time; section 0143).

G09G 3/2066

{with error diffusion in both space and time}

Definition statement

This place covers:

Control of a display for displaying an image having intermediate tones by using error diffusion in space and time, i.e. distributing the quantization error to the neighbouring display elements and the next frame.

Illustrative examples:

US2009/0128693 (quantization error is distributed within the same frame to neighbouring display elements and to the same display element in the next frame)

G09G 3/207

{by domain size control ([G09G 3/3637](#) takes precedence)}

Definition statement

This place covers:

Control of a display to display an image having intermediate tones by varying the area of a display element, which is in one display state, relative to the remaining area of the display element, which is in another display state.

References**Limiting references**

This place does not cover:

Control of a display using liquid crystals having memory effect to display an image having intermediate tones by varying the area of the display element, which is in one display state, relative to the remaining area of the display element, which is in another display state	G09G 3/3637
---	-----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Portions of a pixel that are physically separated or separately controlled are not a case of generating intermediate tones by domain-size control but by using sub-pixels	G09G 3/2074
---	-----------------------------

Illustrative examples:

US2005174623 (modulation of the intermediate tone displayed by an electrochromic display element by varying its coloration area)

G09G 3/2074**{using sub-pixels}****Definition statement***This place covers:*

Control of a display to display an image having intermediate tones by display elements (pixel) having two or more physically separated or separately controllable portions (sub-pixels).

References**Limiting references***This place does not cover:*

Control of a display using liquid crystals having memory effect to display an image having intermediate tones by display elements (pixels) having two or more separately controllable or physically separated portions (sub-pixels)	G09G 3/364
---	----------------------------

Informative references*Attention is drawn to the following places, which may be of interest for search:*

Portions of a pixel that are not physically separated and not separately controlled, but exploit instead a stepped variation across the pixel of a physical variable that affects the state of the pixel itself, are not a case of sub-pixels but of domain size control	G09G 3/207
--	----------------------------

Illustrative examples:

US2002/0195969 (modulation of the intermediate tone by providing two separately selectable organic electroluminescent display element with different areas for each image pixel)

G09G 3/2077

{by a combination of two or more gradation control methods}

Definition statement

This place covers:

Control of a display to display an image having intermediate tones by using two or more methods of generating the intermediate tones together, e.g. by using both sub-pixels and error diffusion.

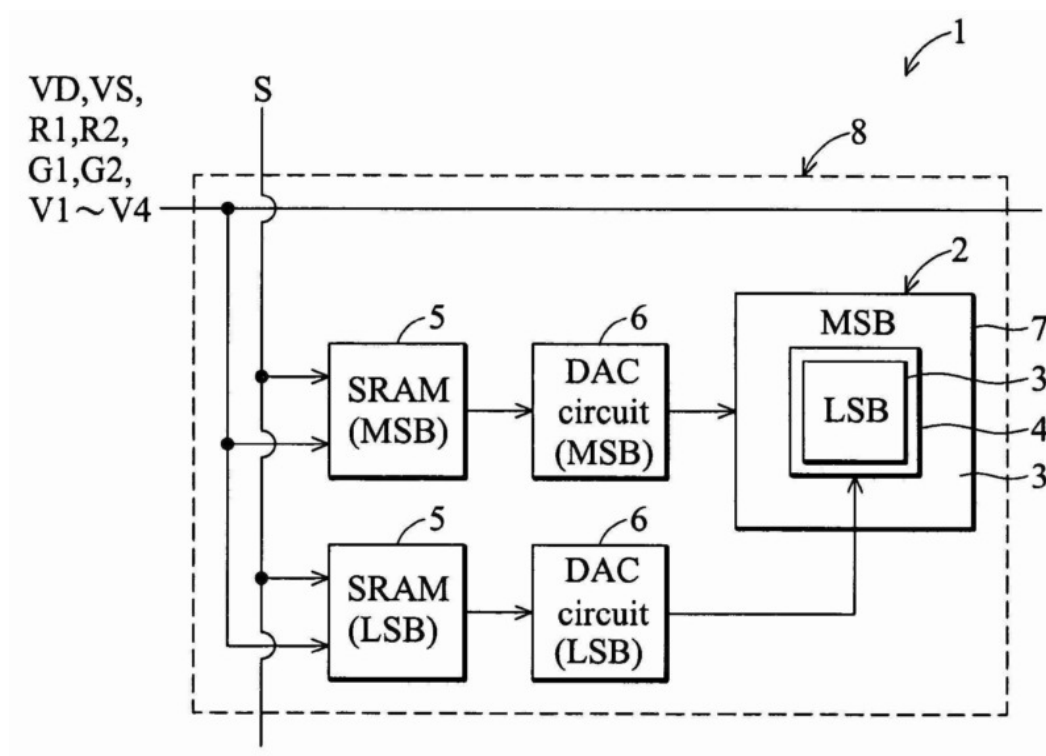

Special rules of classification

Additional codes within [G09G 3/2007](#) should also be given, to indicate which methods of generating the intermediate tones are combined. Code [G09G 3/2011](#) is only given if specific details of the amplitude modulation are present.

As using sub-fields for the control of a plasma display panel to display an image having intermediate tones is a standard method, this code is not given for the combination of using sub-fields with a single other method of generating the intermediate tones in a plasma display panel.

Illustrative examples:

US2009/0128473 (combination of amplitude modulation with using sub-pixels for generating intermediate tones in an LCD)

G09G 3/2081

{with combination of amplitude modulation and time modulation (space and time error diffusion [G09G 3/2066](#))}

Definition statement

This place covers:

Control of a display to display an image having intermediate tones by using amplitude modulation and time modulation.

Special rules of classification

Illustrative example of subject matter classified in this group:

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Display terminal	Means an apparatus connected to a source of display data (usually a graphics controller of a computer, or directly to the computer itself) adapted to display images generated by this source of data. In general a "Display terminal" is an arrangement including a display device (e.g. a CRT with its driving electronic or a flat panel including its row and column drivers), a display device controller (the hardware and software (usually a microprocessor) that controls the display device and that allows its functioning by, for example, generating the signals that are needed to bring the data to the drivers) and a display terminal controller (the hardware and software used to control the display terminal as a whole and to interface the display terminal to the graphics controller, to adapt data and control signals, for example in an LCD driven by a VGA type graphics controller).
------------------	--

Monitor-architecture	means a source of pixelwise image data (rendered data, e.g. RGB data in a VGA video controller; see "Graphics controller" in below figure), e.g. obtained by transforming high-level image descriptions (e.g. graphics primitives) into pixel-wise image data, or by handling analogue video data, or by decompressing compressed video data, an image display unit, which receives said pixel-wise image data (see "Display terminal" in below figure), and an interface between said source of pixelwise image data and said image display unit (commonly RGB-cable with sync-signals, but also other interfaces like USB-bus). A monitor-architecture cannot be identified, if it is not clear where the processing described is located (that is also outside said image display unit); or if the structure of the display system has to be modified if the technology of the display changes (e.g. in a mobile telephone, in which the drivers are normally controlled by the main CPU).
----------------------	--

G09G 3/2096

{Details of the interface to the display terminal specific for a flat panel (suitable for both CRT and flat panel [G09G 5/006](#); specific for a CRT [G09G 1/167](#))}

Definition statement

This place covers:

Details of an interface to a display terminal in a monitor-architecture using a flat panel display, e.g. arrangements for processing of the image data as an adaption for display on the flat panel, or setting of parameters for a flat panel display.

{Display of gradations ([G09G 3/288](#) takes precedence)}

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells having intermediate tones with aspects specific for displays using luminous gas-discharge cells.

References

Limiting references

This place does not cover:

Using alternating current (AC) panels	G09G 3/288
---------------------------------------	----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Control of a display to display an image having intermediate tones with aspects specific for flat panel displays in general	G09G 3/2007
---	-----------------------------

Special rules of classification

For a control of the brightness of a display as a whole, the Indexing Code [G09G 2320/0626](#) should be given in addition.

Illustrative examples:

US5835072 (different intermediate tones are generated in a plasma display panel by varying the value of the voltage applied to the address electrodes during the addressing phase, and a subsequent sustain phase with the application of sustain pulses having different values)

G09G 3/2807

with discharge activated by high-frequency signals specially adapted therefor

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix, wherein the discharge is caused by the application of signals to the gas-discharge cell having a particular high frequency, i.e. significantly higher than known from other displays using luminous gas-discharge cells as display elements arranged in a matrix.

Illustrative examples:

Definition statement

US2004/0056827 (application of pulses with a frequency of 1MHz to the address electrodes during the sustaining phase)

G09G 3/2813

using alternating current [AC] - direct current [DC] hybrid-type panels

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix, wherein in a discharge cell, some of the electrodes that play a role during the discharge are in contact with the ionized gas (as in DC type panels), some are not (as in AC type panels).

Illustrative examples:

US2004/0207572 (control of a plasma display panel with scan, sustain, and address electrodes not in contact with the ionized gas, and further electrodes in contact with the ionized gas)

G09G 3/282**using DC panels****Definition statement***This place covers:*

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix, wherein in a discharge cell, the electrodes that play a role during the discharge are in contact with the ionized gas.

Illustrative examples:

US5332949 (control of a plasma display panel with scan, sustain, and address electrodes in contact with the ionized gas)

**G09G 3/285****using self-scanning****Definition statement***This place covers:*

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in a DC panel, wherein the discharge is sequential transferred from an input position to a further display position.

G09G 3/288

using AC panels

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the discharge are not in contact with the ionized gas.

Special rules of classification

Only to be given in exceptional cases, when none of the subgroups of [G09G 3/288](#) applies.

G09G 3/29

using self-shift panels {with sequential transfer of the discharges from an input position to a further display position}

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix, wherein the discharge is sequentially transferred from an input position to a further display position.

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Display panels with cold-cathode tubes	H01J 17/49
--	----------------------------

Examples:

US5212472 (discharge is sequentially transferred, as discharge in the previous cell generates charges to enable a discharge in the adjacent next cells)

G09G 3/291

controlling the gas discharge to control a cell condition, e.g. by means of specific pulse shapes

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell.

G09G 3/292

for reset discharge, priming discharge or erase discharge occurring in a phase other than addressing

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an erase discharge outside the addressing phase, a reset discharge, or a priming discharge.

G09G 3/2922

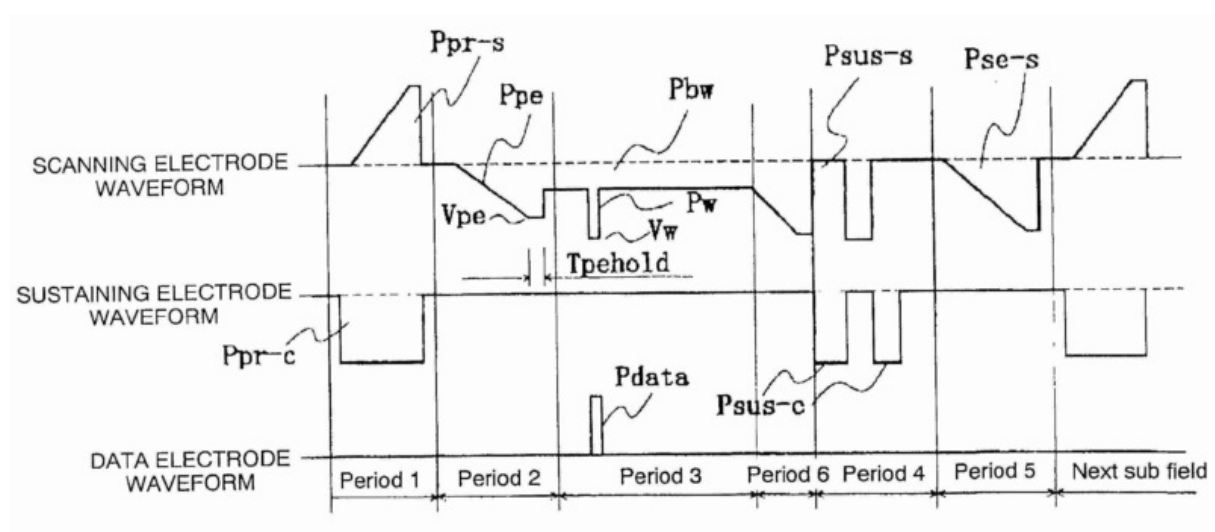

{Details of erasing}

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an erase discharge outside the addressing phase and outside the reset phase at least once per frame.

Illustrative example of subject matter classified in this place:

Definition statement

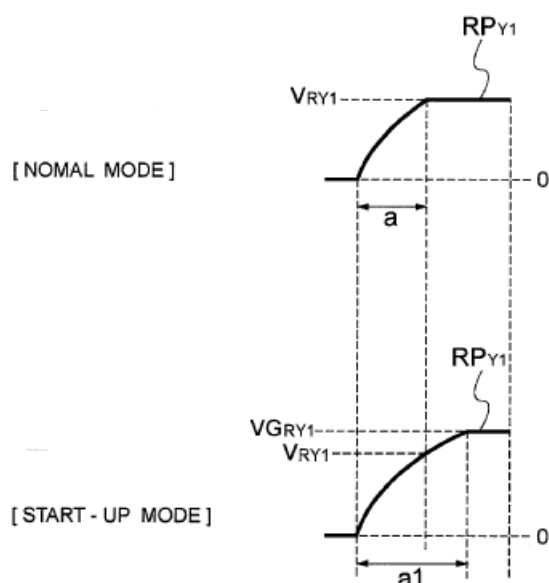

The Figure illustrates an erasing discharge that is generated to remove charges in those discharge cells, in which no address discharge is generated in the preceding addressing phase in order to avoid an erroneous discharge in the subsequent sustaining phase.

G09G 3/2925**{Details of priming}****Definition statement**

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating a priming discharge at the time of powering up the display or at regular intervals.

Illustrative example of subject matter classified in this place:

The Figure illustrates the application of a pulse with larger maximum value during the initialising phase in a start-up mode after the powering on of a plasma display panel than in a normal mode.

Special rules of classification

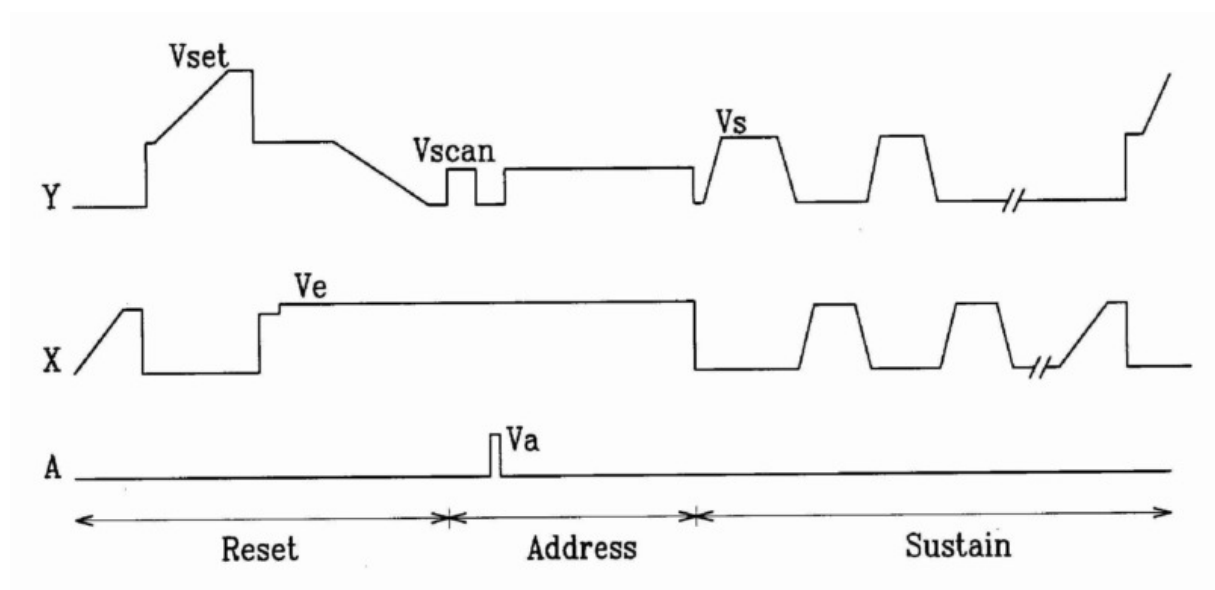

Classification is to be made in this group if a discharge for priming, i.e. for generating charges in the discharge cell, is generated at the time of powering up the display or at regular intervals.

G09G 3/2927**{Details of initialising}****Definition statement**

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating a reset discharge, i.e. for initialising the gas-discharge cell as a preparation of the subsequent addressing phase.

Illustrative example of subject matter classified in this place:

The Figure illustrates the application of pulses with rising and falling slope to the scan and sustain electrode during a reset phase for generating discharges in order to provide the same wall charge conditions in all the discharge cells as a preparation for the subsequent addressing phase.

Special rules of classification

Classification is to be made in this group if a reset discharge, i.e. for initialising the gas-discharge cell as a preparation of the subsequent addressing phase, is generated during every sub-frame, every frame or every multiple frames.

G09G 3/293

for address discharge

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an address discharge, i.e. an discharge for selecting the discharge cell according to the display data so that a sustain discharge with light emission takes place in the subsequent sustain phase corresponding to the selection in the addressing phase.

Special rules of classification

Different control or pulse shapes for different sub-frames are to be indicated by the code

[G09G 3/2022](#).

G09G 3/2932**{Addressed by writing selected cells that are in an OFF state}****Definition statement***This place covers:*

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an address discharge, wherein the generation of the address discharge generates sufficient wall charges in the addressed cell so that a sustain discharge with light emission takes place in the subsequent sustain phase.

Special rules of classification

Different control or pulse shapes for different sub-frames are to be indicated by the code

[G09G 3/2022](#).

Illustrative examples:

US2003/0102814 (a discharge generated selectively only in those discharge cells during an addressing phase having a pulse applied to the address electrode together with a pulse applied to the scanning electrode generates wall charges, which enable a lighting discharge in these selected cells during the subsequent sustaining phase)

**G09G 3/2935****{Addressed by erasing selected cells that are in an ON state}****Definition statement***This place covers:*

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an address discharge, wherein the generation

Definition statement

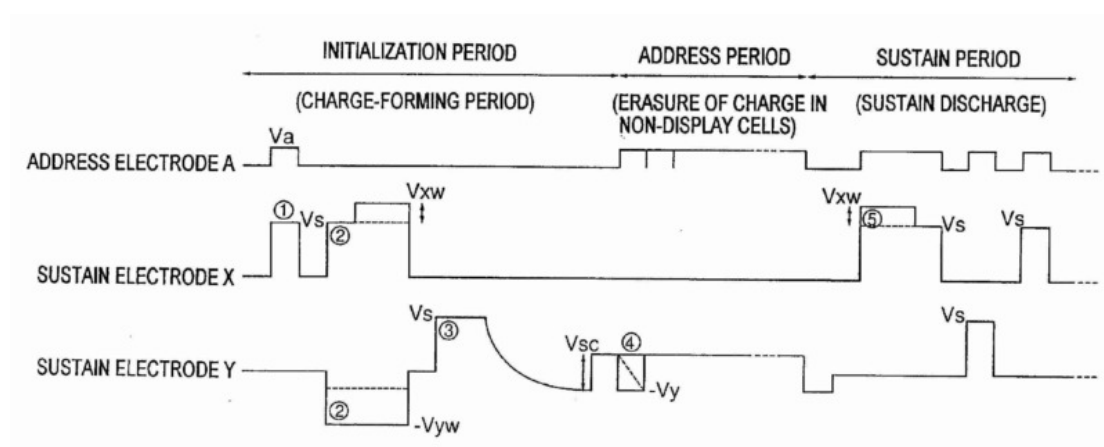

of the address discharge reduces or erases the wall charges in the addressed cell so that no sustain discharge with light emission takes place in the subsequent sustain phase.

Special rules of classification

Different control or pulse shapes for different sub-frames are to be indicated by the code [G09G 3/2022](#).

Illustrative examples:

EP0866439 (after generating wall charges in all the discharge cells during the initialisation phase, a discharge erases the wall charges selectively only in those discharge cells during an addressing phase having a pulse applied to the address electrode together with a pulse applied to the scanning electrode, which disables a lighting discharge in these selected cells during the subsequent sustaining phase)

**G09G 3/2937**

{being addressed only once per frame}

Definition statement

This place covers:

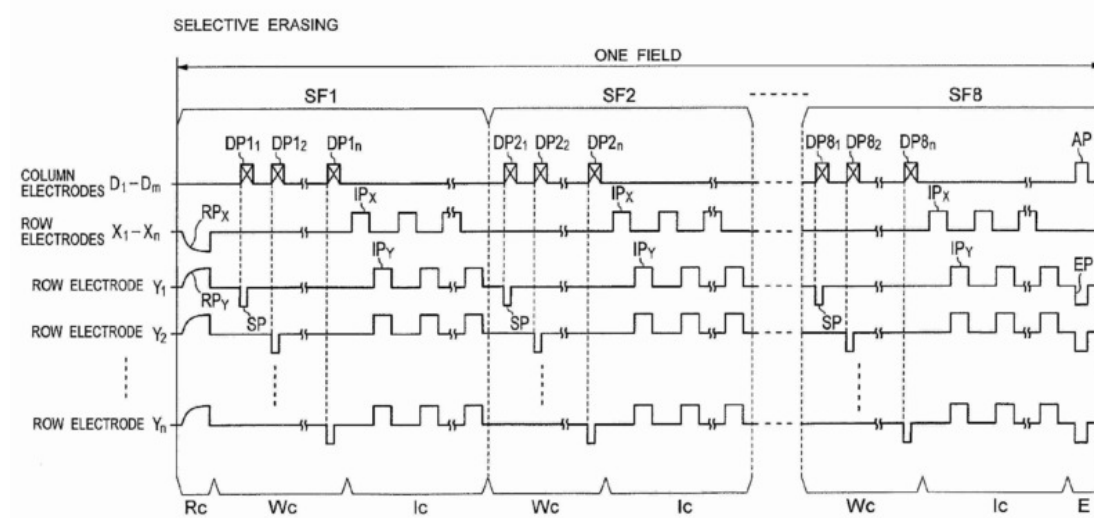

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an address discharge, wherein the generation of the address discharge takes place only in one sub-frame of a frame

Illustrative examples:

US2002/0036603 (as the resetting operation is performed only in the first sub-frame, in the following sub-frames only discharge cells not addressed by erasing in the preceding sub-frames can be

Definition statement

selected in the addressing phase of a sub-frame by erasing to no longer emit light in the sustaining phase of the sub-frame and all the further sub-frames of the frame)

G09G 3/294

for lighting or sustain discharge

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an lighting or sustain discharge, i.e. a discharge for lighting the discharge cells selected during the addressing phase, wherein after the discharge enough charges remain in the cell to generate a further discharge with the next pulse of the same shape, and wherein, if an image having intermediate tones is generated by using sub-frames, the number of lighting discharges corresponds to the grey scale bit of the sub-frame.

Special rules of classification

Different control or pulse shapes for different sub-frames are to be indicated by the code

[G09G 3/2022](#).

G09G 3/2942

{with special waveforms to increase luminous efficiency}

Definition statement

This place covers:

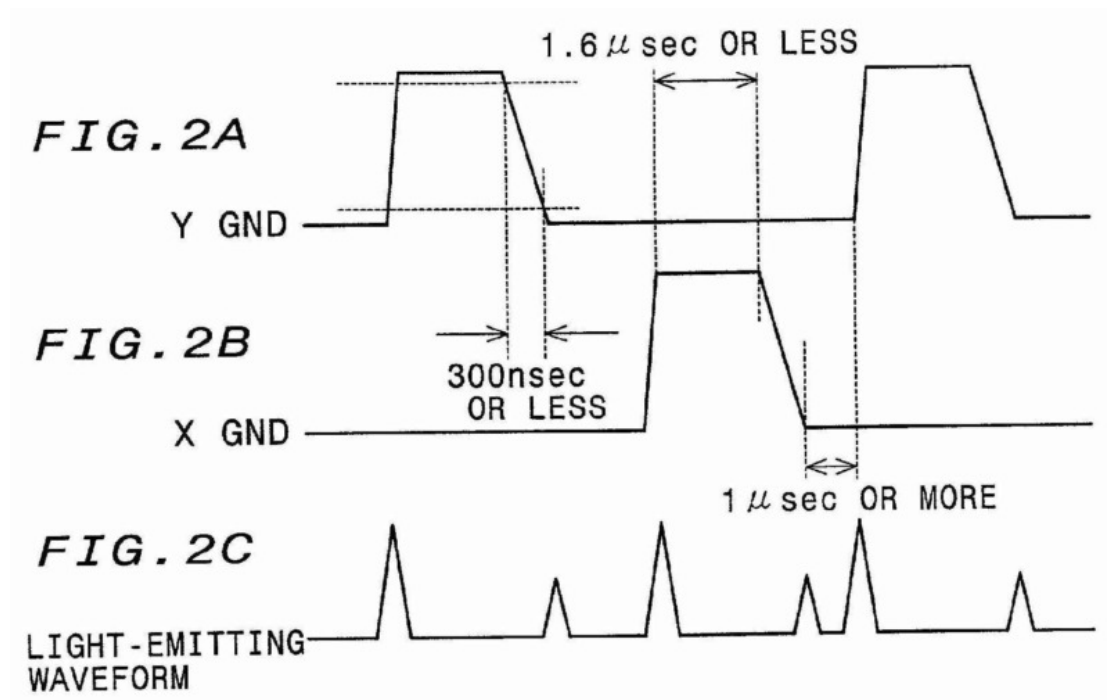

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an lighting or sustain discharge, wherein the luminous efficiency of the panel is increased by applying special waveforms, for instance by waveforms generate two luminous discharges with a single pulse.

Special rules of classification

Different control or pulse shapes for different sub-frames are indicated by the code [G09G 3/2022](#).

Illustrative examples:

US2002/0008680 (increase of the luminous efficiency by generating a light emitting discharge with the rising and the falling slope of each sustaining pulse)

G09G 3/2944

{by varying the frequency of sustain pulses or the number of sustain pulses proportionally in each subfield of the whole frame}

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an lighting or sustain discharge, wherein the frequency of the sustain pulses or the number of sustain pulses is varied by the same factor for each subfield of a frame.

Illustrative examples:

EP1065645 (variation of the sustain pulse number with the same factor for all the sub-frames)

		SUSTAINING PULSE NUMBERS OF RESPECTIVE SF				
		SF1	SF2	SF3	SF4	SF5
TOTAL SUSTAINING PULSE NUMBER	31	1	2	4	8	16
	93	3	6	12	24	48
	158	5	11	21	40	81
	248	8	16	32	64	128
	312	10	21	40	81	160

G09G 3/2946

{by introducing variations of the frequency of sustain pulses within a frame or non-proportional variations of the number of sustain pulses in each subfield}

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an lighting or sustain discharge, wherein the frequency of the sustain pulses or the number of sustain pulses is varied for at least one subfield of a frame differently from the other subfields of the frame.

Illustrative examples:

Definition statement

US2005/0219158 (variation of the sustain frequency for a sub-frame according to the display load of the sub-frame, i.e. the number of cells to emit light during the sub-frame)

**G09G 3/2948**

{by increasing the total sustaining time with respect to other times in the frame}

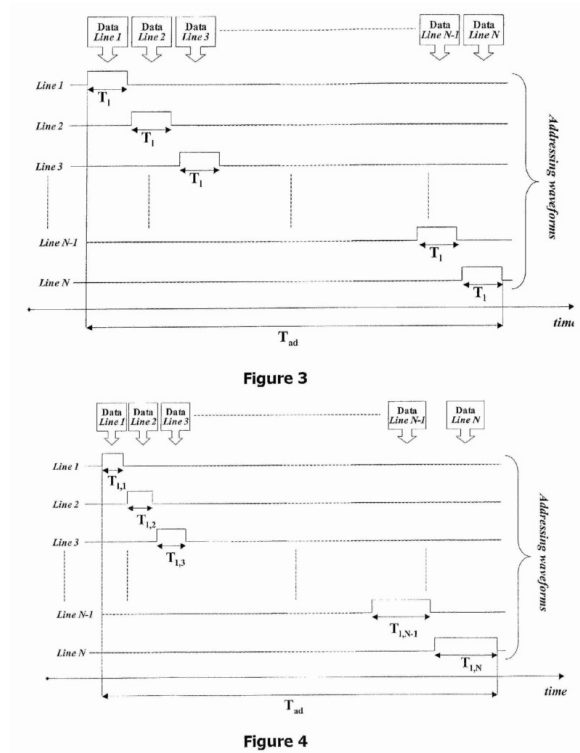

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel with details of the control of the gas-discharge cell or the shape of the pulses applied to the electrodes of the gas-discharge cell for generating an lighting or sustain discharge, wherein the time period available for the sustaining phase is increased with respect to other time periods in the frame, e.g. pulses in the initialising phase or the addressing phase are modified in order to shorten the time periods needed for these phases and thus enable an increase in light emission by a longer time period for the sustain phase.

Illustrative examples:

EP1365382 (shorter addressing and scanning pulses for addressing the upper scanning lines saves time available for the sustain phase)

G09G 3/296

Driving circuits for producing the waveforms applied to the driving electrodes

Definition statement

This place covers:

Details of a drive circuit for applying pulses to the electrodes of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel.

G09G 3/2965

{using inductors for energy recovery}

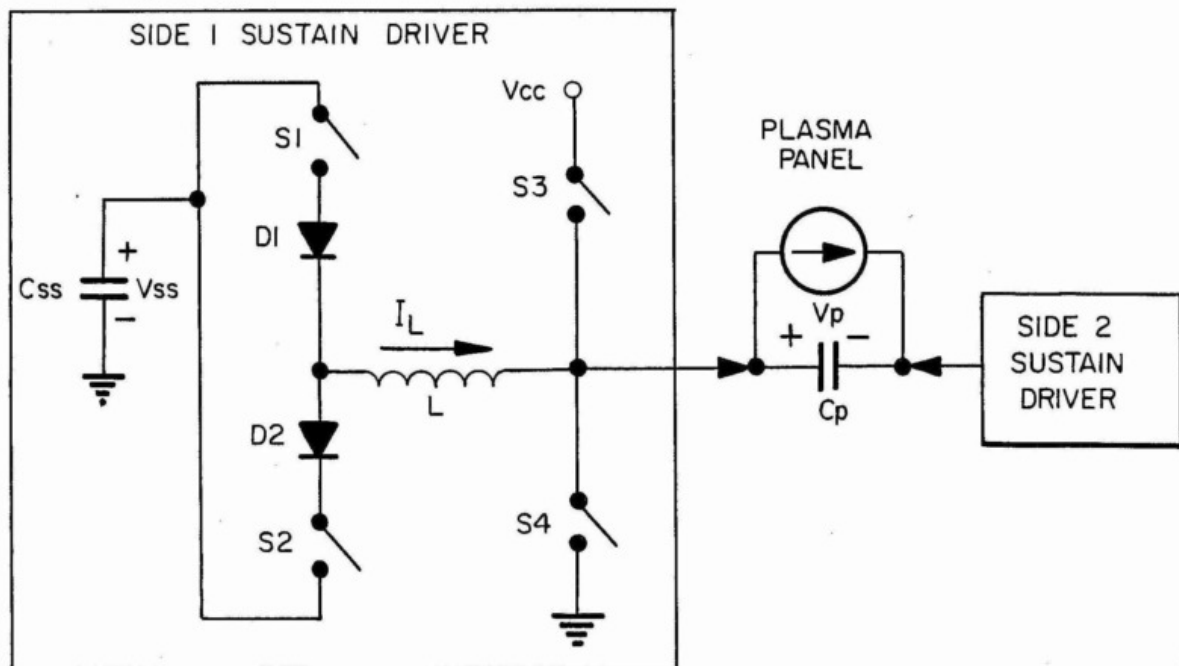

Definition statement

This place covers:

Details of a drive circuit for applying pulses to the electrodes of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, which uses inductors in a circuit for recovering the energy from the electrodes of the display.

Definition statement

Illustrative example of subject matter classified in this place:

The Figure illustrates a sustain electrode drive circuit with energy recovery circuit using an inductor.

G09G 3/297

using opposed discharge type panels

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the sustain discharge are opposite to each other.

Illustrative examples:

US2007/0171174 (control of AC plasma display panel with address electrodes on a substrate as well as scan and sustain electrodes in the cell walls and opposite to each other)

G09G 3/298**using surface discharge panels****Definition statement**

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the sustain discharge are on the same surface.

Special rules of classification

For documents published after 1997 this code is only to be given if no other class under [G09G 3/288](#) is given for a surface discharge panel, as most of the documents after 1997 concern surface discharge panels anyway.

G09G 3/2983**{using non-standard pixel electrode arrangements}****Definition statement**

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the sustain discharge are on the same surface, and the discharge cell electrodes have a non-standard arrangement.

G09G 3/2986**{with more than 3 electrodes involved in the operation}****Definition statement**

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the sustain discharge are on the same surface, and with more than three electrodes involved in the operation of the discharge cell.

Special rules of classification

Also if a neighbouring electrode is involved in the operation of the discharge cell beside the three electrodes corresponding to the discharge cell, such a document is to be classified in this group.

Illustrative examples:

US2005/0116899 (operation of the discharge cell by signals applied to four electrodes, A, M, X, Y)

G09G 3/299

using alternate lighting of surface-type panels

Definition statement

This place covers:

Control of displays using luminous gas-discharge cells as display elements arranged in a matrix in an AC panel, wherein in a discharge cell the electrodes that play a role during the sustain discharge are on the same surface, and with alternate lighting of the cells of one row and in even columns, and an adjacent other row and in odd columns.

Illustrative examples:

Definition statement

EP1199701 (using all the discharge gaps between the scan and sustain electrodes enables a reduction of the number of electrodes and thus a cost reduction, but requires alternate lighting of the odd and even lines)

FIG. 7

FIG. 8

**G09G 3/30****using electroluminescent panels****Definition statement**

This place covers:

Control of displays using electroluminescent display elements arranged in a matrix.

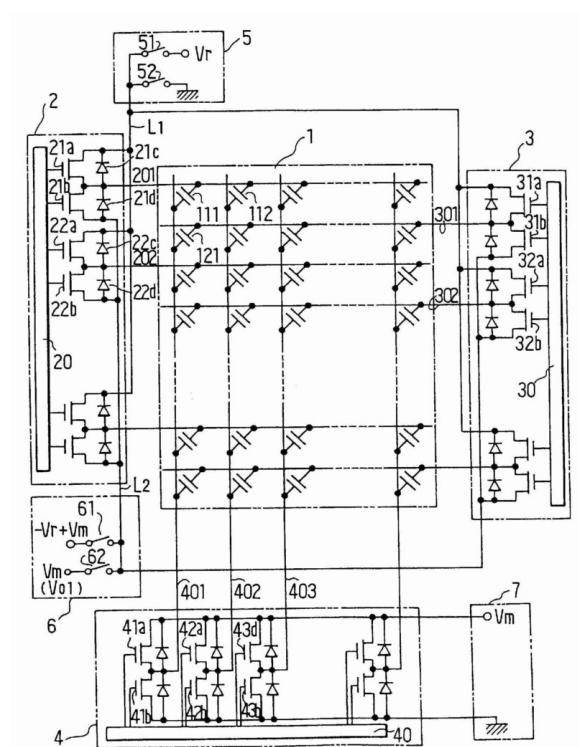

References**Informative references**

---	---------------------------

G09G 3/3208**organic, e.g. using organic light-emitting diodes [OLED]****Definition statement***This place covers:*

Control of displays using organic electroluminescent display elements, which are semiconductor devices, e.g. diodes or transistors, arranged in a matrix, wherein the semiconductive material is organic.

References**Informative references***Attention is drawn to the following places, which may be of interest for search:*

Control of displays using electroluminescent display elements, which are semiconductor devices, e.g. diodes or transistors, for displaying a character composed by a fixed number of display elements as segments or dots	G09G 3/14
Details of the drive circuits for applying the scan signals to the scan electrodes of an organic electroluminescent matrix display	G09G 3/3266

Organic light-emitting devices [OLED]	H10K 50/00
Integrated devices, or assemblies of multiple devices, comprising at least one organic light-emitting element	H10K 59/00
Integrated devices, or assemblies of multiple devices, comprising at least one organic light-emitting element and at least one organic radiation-sensitive element	H10K 65/00

Special rules of classification

This code is to be given only if no details of the control of the display elements are specified, otherwise the codes of [G09G 3/3216](#) for a passive matrix, or within [G09G 3/3225](#) for an active matrix apply.

G09G 3/3216**using a passive matrix****Definition statement***This place covers:*

Control of displays using organic electroluminescent display elements arranged in a matrix, wherein each display element is located at the intersection of a scan and a data electrode, and directly controlled by the scan and data signal supplied to the scan and data electrode, respectively, i.e. without an active element such as a diode (other than the light-emitting one), or a transistor at the intersection being involved.

Definition statement

The figure below is an example of a passive matrix. In the figure, passive matrix is characterized as having a line driving method which lights all light-emitting devices of the line at once, and a matrix is a 2-dimensional arrangement, comprising cathode and anode strips.

The figure below is an example of selective application of a current to the anodes of OLED display elements as data signal via data electrodes A_k while a voltage is supplied to the cathodes of the display elements as scan signal via scan electrodes.

Details of the drive circuits for applying the data signals to the data electrodes of an organic electroluminescent matrix display	G09G 3/3275

G09G 3/3225**using an active matrix****Definition statement**

This place covers:

Control of displays using organic electroluminescent display elements arranged in a matrix, wherein each display element is located together with an active element such as a transistor or a diode, other than the light-emitting one, at the intersection of a scan electrode and a data electrode. The active element has to be enabled by the application of a scan signal to the scan electrode so that the display element receives the data signal.

The figure below is an example of an active-matrix. In the figure, active-matrix is an individual driving method where light-emitting devices are turned on by each film transistor (TFT), and a matrix is an arrangement of light-emitting devices or TFTs or their combinations.

G09G 3/3233

with pixel circuitry controlling the current through the light-emitting element

Definition statement

This place covers:

Control of displays using organic electroluminescent display elements arranged in a matrix together with active elements, wherein each active element enables a driving current flowing through a display element corresponding to a data signal supplied to a data electrode. The corresponding active element must concurrently be selected by a scan signal supplied to its scan electrode.

The figure below is an example of data voltage signal supplied to the data line (14), which controls the driving current flowing through the organic electroluminescent display element.

Details of the drive circuits for applying the data signals to the data electrodes of an organic electroluminescent matrix display	G09G 3/3275

G09G 3/3241

the current through the light-emitting element being set using a data current provided by the data driver, e.g. by using a two-transistor current mirror

Definition statement

This place covers:

Control of displays using organic electroluminescent display elements arranged in a matrix together with active elements, wherein each active element enables a driving current flowing through a display

Definition statement

element corresponding to a data current supplied to a data electrode, which is supplied when the active element is activated by a scan signal supplied to a scan electrode, e.g. by a current mirror having the data current flowing through the data electrode as an input current, and the driving current flowing through the display element as an output current.

The figure below is an example of data current signal supplied to the data line DL and flowing through the input part PM2 of a current mirror circuit, which controls the driving current flowing through the output part PM1 of the current mirror circuit and the organic electroluminescent display element)

G09G 3/325

the data current flowing through the driving transistor during a setting phase, e.g. by using a switch for connecting the driving transistor to the data driver

Definition statement

This place covers:

Control of displays using organic electroluminescent display elements arranged in a matrix together with active elements, wherein each active element enables a driving current flowing through a display element corresponding to a data current flowing through a data electrode and through a driving transistor, but not through the display element connected in series with the driving transistor, during a first period when the active element is activated by a scan signal supplied to a scan electrode, and with the driving current flowing through the driving transistor and the display element during a second period when the scan signal is not supplied to the scan electrode, e.g. by a first switch connecting the driving transistor to the data electrode during the first period, and a second switch connecting the driving transistor to the display element during the second period.

The figure below is an example where the data current signal I_{dat} is applied to the data line and flows only through the driving transistor T2 during the scan period (T1 and T3 ON, T4 OFF), and through the

Definition statement

driving transistor and the organic electroluminescent display element after the scan period (T1 and T3 OFF, T4 ON).

**G09G 3/3258**

with pixel circuitry controlling the voltage across the light-emitting element

Definition statement

This place covers:

Control of displays using organic electroluminescent display elements arranged in a matrix together with active elements, wherein each active element enables the application of a voltage across a display element corresponding to a data signal supplied to a data electrode. The corresponding active element must concurrently be selected by a scan signal supplied to a scan electrode.

Definition statement

The figure below is an example where the application of a scan signal on a line, 7-j ($1 \leq j \leq m$), enables the transistors of pixels belonging to that line. The light-emitting diodes of the line can then receive data by supplying a data signal on column 6-k ($1 \leq k \leq n$).

G09G 3/3266

Details of drivers for scan electrodes

Definition statement

This place covers:

Details of a drive circuit for supplying scan signals to scan electrodes of an organic electroluminescent matrix display.

G09G 3/3275

Details of drivers for data electrodes

Definition statement

This place covers:

Details of a drive circuit for supplying data signals to data electrodes of an organic electroluminescent matrix display.

G09G 3/3283

in which the data driver supplies a variable data current for setting the current through, or the voltage across, the light-emitting elements

Definition statement

This place covers:

Details of a drive circuit for supplying data signals to data electrodes of an organic electroluminescent matrix display, the data signals being in the form of a variable data current value according to the data to be displayed.

G09G 3/3291

in which the data driver supplies a variable data voltage for setting the current through, or the voltage across, the light-emitting elements

Definition statement

This place covers:

Details of a drive circuit for supplying data signals to data electrodes of an organic electroluminescent matrix display, the data signals being in the form of variable data voltage value according to the data to be displayed.

G09G 3/34

by control of light from an independent source

Definition statement

This place covers:

- Passive displays reflecting or modulating the incident light.
- Displays comprising a passive and an active panel.

Detail of drivers for data electrodes	G09G 3/3685
Generation of voltages supplied to electrode drivers	G09G 3/3696

G09G 3/3625

{using active addressing}

Definition statement

This place covers:

In traditional multiplexing, the rows are addressed in sequence and only one at a time. The voltages set on the columns correspond to the pixel values in the row being addressed. This scheme leads to very low voltage selection ratios and, consequently, low contrast.

In the Active Addressing scheme, several rows are addressed simultaneously in different patterns corresponding to orthogonal functions. A set of functions is orthogonal over a certain interval if the integral of the product of any two of the functions is 0 if the functions are different, and a constant if they are the same function. From signal processing theory, we can represent a given signal as a sum of differing amounts of these orthogonal functions. If we suppose the signal we wish to represent is the sequence of pixel values in a particular column of a display, then we can create that signal by applying the correct orthogonal functions to the row lines and certain voltages on the column line that correspond to the amounts of those functions we want. If we use the same functions to represent the

Definition statement

signals in the other columns, then we can create a whole display by applying the correct voltages to all of the column lines in parallel.

Special rules of classification

Documents classified in [G09G 3/3625](#) shall not receive an Indexing Code for active addressing ([G09G 2310/0208](#)).

Illustrative example:

Order 32 Walsh functions. These kinds of functions serve as the voltage settings for the row lines in active addressing.

G09G 3/3629

{using liquid crystals having memory effects, e.g. ferroelectric liquid crystals}

Definition statement

This place covers:

Control of:

- ferroelectric LCDs, i.e. LCs having a polarization vector, that causes an inherent memory effect, shown in a single memory loop in the transmission/voltage characteristic has, such as chiral smectic LCs.
- Nematic LCDs (chiral nematic) where two metastable states are obtained by others means.
- LCDs using a "type" transition to obtain memory effects (nematic - cholesteric).

EP957394 (nematic-cholesteric LCDs with planar and focal conic states)

G09G 3/3633

{with transmission/voltage characteristic comprising multiple loops, e.g. antiferroelectric liquid crystals}

Definition statement

This place covers:

Control of:

- Antiferroelectric LCDs having two antiferroelectric states for positive and negative pixel voltages and a ferroelectric state without pixel voltage, both with symmetric or asymmetric loops, where memory effects are desired and used.
- Short pitch ferroelectric LCDs [SBF LCDs] where the helix pitch is shorter than the pixel cell thickness.

G09G 3/3637

{with intermediate tones displayed by domain size control (domain size control in flat matrix panels other than liquid crystal displays having memory effects [G09G 3/207](#))}

Definition statement

This place covers:

- Control of LCDs having memory effect (e.g. ferroelectric) where gradation is obtained by varying the extension of the pixel area where switching from one memory state (e.g. ferroelectric state) to the other takes place, e.g. by.
- Arranging the electrodes such to vary the applied voltage across the pixel, so that a gradient in the LC electric field is obtained.
- Varying the thickness of the LC cell across the pixel.

- Simply using unevenness in the LC cell structure.

Detail of drivers for scan electrodes	G09G 3/3674
Detail of drivers for data electrodes	G09G 3/3685
Generation of voltages supplied to electrode drivers	G09G 3/3696

G09G 3/3655

{Details of drivers for counter electrodes, e.g. common electrodes for pixel capacitors or supplementary storage capacitors}

Definition statement

This place covers:

- Driving circuits for common electrodes of:

Definition statement

- pixels;
- supplementary-capacitors (in this case consider Indexing Code [G09G 2300/0876](#) as well).
- Striped or segmented common electrodes.
- Driving of electrode groups.
- Driving with additional line selector (shift register).
- Use of common electrodes as additional selection line.
- Problems related to resistance or capacity of common electrodes (if compensated via the same).
- Pixel voltage manipulation via common electrode(s).
- Increase pixel voltage (by modifying counter electrode voltage at appropriate time).
- Application of compensation voltages (e.g.: feedthrough, crosstalk, view angle, temperature) via the counter electrodes.

G09G 3/3659

{the addressing of the pixel involving the control of two or more scan electrodes or two or more data electrodes, e.g. pixel voltage dependant on signal of two data electrodes}

Definition statement

This place covers:

- Pixel selection or control:
- logical AND/OR (in connection with several pixel TFTs)
- via additional gate lines (two per pixel)
- via adjacent gate lines (each gate line used for two pixels)
- Control of D/A converter in pixel (via additional lines)
- Control of variable capacitor in pixel
- Pixel voltage manipulation
- pixel capacitor or supplementary capacitor connected to (or adjacent to)
- GATE line (first gate line selects TFT, second manipulates pixel voltage)
- DATA line (voltage difference on data lines defines pixel voltage)
- pixel voltage defined by voltage between a gate line and a data line
- Redundancy in the driving, precharging or symmetry
- pixel driven twice, once via a first TFT and a first data line, then via second TFT and second data line
- structures with multiple TFTs (multiple redundant selection or data paths).

G09G 3/3662

{using plasma-addressed liquid crystal displays}

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

EP0651368

G09G 3/3666

{with the matrix divided into sections}

Relationships with other classification places

Video-walls, which consist out of modules, meant to be flexibly combined into a bigger size display, e.g. for installation or configuration purposes (see [G06F 3/1446](#) and [G09G 2300/026](#)).

Matrices where the split has no impact on the driving, i.e. it is just a convenient constructional measure or it serves other purposes (heat dispersion etc.). Possible classifications for such cases are again in [G06F 30/00](#), [H10D 86/60](#), or in groups related to the physical structure of specific display technologies (e.g. [G02F 1/13](#) for LCDs).

Splitting of matrices in a way that the resulting structure cannot be driven independently from each other, e.g. driving odd lines from one driver and even lines from another driver.

G09G 3/367

{with a nonlinear element in series with the liquid crystal cell, e.g. a diode, or M.I.M. element}

Definition statement

This place covers:

Control of pixel circuits wherein a diode string or a variable resistor is connected in series with the LC cell.

Details of drivers for data electrodes, other than drivers for liquid crystal, plasma or OLED displays	G09G 2310/0275
--	--------------------------------

Special rules of classification

Documents receiving this code usually do not receive [G09G 2310/0275](#) .

However, documents should be given the following codes in addition to [G09G 3/3685](#), if applicable when they contain the corresponding details:

- Digital gray scale data driver in matrix panels, e.g. including D/A converter [G09G 2310/027](#)
- The data driver communicating data to the pixels by means of a current [G09G 2310/0272](#) .

G09G 3/3696

{Generation of voltages supplied to electrode drivers}

Definition statement

This place covers:

Generation of driving voltages, as distinguished from power supply voltages, to be used by the drivers for the generation of waveforms applied to the electrodes.

Definition statement

Although some of the driving voltages may possibly be coincident with the power supply voltages (normally the extreme voltage values), driving voltages serve the purpose of composing an electrode addressing waveform, rather than supplying power to a functional unit; driving voltages may be representative of gradation levels (AM gradations) or may merely be levels required by a complex waveform (e.g. in the addressing of passive matrix LCDs, FLCDS, electrophoretic panels etc).

The lines/electrodes to which driving voltages are applied may or may not draw power from the generating circuit; driving voltages may normally be regarded as reference voltages, and normally for them only very small fluctuations are tolerated.

The generation of voltages is different than the generation of signals applied to the electrodes.

Illustrative examples:

- US2007046600 (Generation, by means of an arrangement of resistor ladders and selectors of voltages corresponding to gradation levels for an active matrix LCD, that take into account also the required gamma correction; the generated voltages are then selectively applied to the signal lines by the corresponding driver)
- US2008007502 (Charge pumps are used to generated voltage levels used for driving an LCD; not necessarily corresponding to the power supply level of the circuitry, possibly higher)
- WO9100588 (Generation by means of arrangements of resistor ladders, buffers etc., of voltages used in the composition of (possibly) complex waveforms driving rows and columns in a passive LCD)

using electrochromic devices

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Control of e.g. intensity or colour of light based on electrochromic elements	G02F 1/15
---	---------------------------

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Electrochromic devices	Comprise one or more electrochromic matrix-elements named cells or pixels or dots, etc, such as information displays. Each element is composed of at least two electrodes that are electrically connected via an ion-conducting medium, i. e. an electrolyte. The elements may change colour if the potential difference between the electrodes is changed. This colour change is caused by redox reactions, i. e. changes in the distribution of electric charge within the element. The colour changes are caused by changes in the spectral absorption and/or emission properties of electromagnetic radiation. With 'colour' we mean also the spectral properties outside the visible region, e.g. in the infrared and the ultraviolet regions.
------------------------	---

G09G 5/00

Control arrangements or circuits for visual indicators common to cathode-ray tube indicators and other visual indicators (image data processing or generation, in general [G06T](#))

Definition statement

This place covers:

Applicable when common to all display technology. By example when display technologies are not specific to LCD but to LCD, Plasma and OLEDs. (also CRTs but it is no more relevant in 2011).

Special rules of classification

See also image data processing or generation, in general [G06T](#).

G09G 5/001

{Arbitration of resources in a display system, e.g. control of access to frame buffer by video controller and/or main processor}

Definition statement

This place covers:

Resolving memory contention by CRT controller and the CPU, eventually combined with refresh of the dynamic memory.

Illustrative examples of subject matter classified in this place:

1.

Figure 1 illustrates a bit-map based display system.

Definition statement

2.

Figure 2 illustrates a display system with video synchronization.

3.

Figure 3 illustrates a display system with blending graphics and video surfaces.

4.

Figure 4 illustrates a method for bitmapping and synchronization.

Definition statement

5.

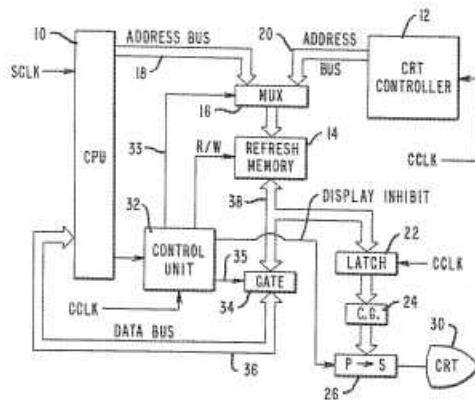

Figure 5 illustrates a character-based display system.

6.

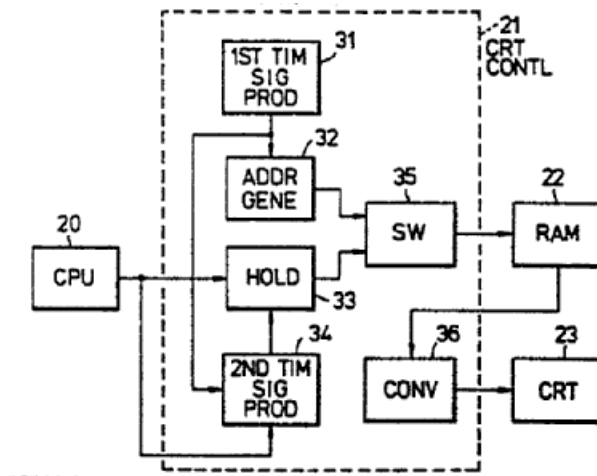

Figure 6 illustrates a display control unit that is both bit-map and character-based.

7a.

7b.

Figures 7a and 7b illustrate a generic display control unit.

Limiting references

This place does not cover:

Colour circuits specific for CRT	G09G 1/28
----------------------------------	---------------------------

Special rules of classification

Even though the groups [G09G 1/165](#) and [G09G 3/2092](#) still exist, they should be used in very special cases only in which the connection with the technology of the display unit (CRT or flat panel) determines the content of the document.

The codes [G09G 5/003](#) and below apply only if a monitor-architecture can be identified (the same rule applies for [G09G 3/2092](#) and [G09G 1/165](#)).

The following groups should also be searched, because they have not yet been purged of documents for [G09G 5/003](#)

[G09G 3/3611](#): control of matrices with row and column drivers

[G06F 3/147](#): using display panels

[G06F 3/153](#): using cathode-ray tubes

[G09G 1/285](#): interfacing with colour displays

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Display terminal	an apparatus connected to a source of display data (usually a graphics controller of a computer, or directly to the computer itself) adapted to display images generated by this source of data. In general a "display terminal" is an arrangement including a display device (e.g. a CRT with its driving electronic or a flat panel including its row and column drivers), a display device controller (the hardware and software (usually a microprocessor) that controls the display device and that allows its functioning by, for example, generating the signals that are needed to bring the data to the drivers) and a display terminal controller (the hardware and software used to control the display terminal as a whole and to interface the display terminal to the graphics controller, to adapt data and control signals, for example in an LCD driven by a VGA type graphics controller).
------------------	--

G09G 5/005

{Adapting incoming signals to the display format of the display terminal}

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Scaling the whole image or part thereof	G06T 3/40
---	---------------------------

Special rules of classification

The codes [G09G 5/003](#) and below (thus including [G09G 5/005](#)) apply only if a monitor-architecture can be identified (the same rule applies for [G09G 3/2092](#) and [G09G 1/165](#)).

Used to be a subgroup of [G09G 5/006](#) (now [G09G 5/006](#)), this code applies independently of where the adaptation is done, in the interface or in the controller of the terminal. Most of the documents in this group will relate to flat panels, since a CRT does not need, in general, any adaptation. It was decided, however, to have a single classification for all the documents dealing with this problem.

The output of the interface usually will be a frame or a line buffer, the latter may well be included in the data driver of the visualization unit.

The following groups should also be searched, because they have not yet been purged of documents for [G09G 5/005](#):

[G09G 3/3611](#): control of matrices with row and column drivers

[G06F 3/147](#): using display panels

[G06F 3/153](#): using cathode-ray tubes

[G09G 1/285](#): interfacing with colour displays

Notes on new groups:

G09G 5/008

{Clock recovery}

Definition statement

This place covers:

Some digital data streams, especially high-speed serial data streams (also for analog signal with hsync and vsync synchro decoding to recreate the pixel clock) are sent without an accompanying clock signal. The receiver generates a clock from an approximate frequency reference, and then phase-aligns to the transitions in the data stream with a phase-locked loop (PLL). This process is commonly known as clock and data recovery (CDR).

In order for this scheme to work, a data stream must transition frequently enough to correct for any drift in the PLL's oscillator. The limit for how long a clock recovery unit can operate without a transition is known as its maximum consecutive identical digits (CID) specification. To ensure frequent transitions, some sort of encoding is used; 8B/10B encoding is very common, while Manchester encoding serves the same purpose.

Special rules of classification

This group used to be a subgroup of [G09G 5/006](#) (now [G09G 5/006](#); see notes there), this code applies if the clock recovery is performed within the display interface of a monitor-architecture. Most of the documents in this group will relate to flat panels, since a CRT does not need, in general, any adaptation. It was decided, however, to have a single classification for all the documents dealing with this problem.

Notes on new groups:

[G09G 5/006](#) is former [G09G 5/006](#) and [G09G 5/006](#)

[G09G 5/005](#) is former [G09G 5/005](#)

[G09G 5/008](#) is former [G09G 5/008](#)
