H01C

RESISTORS

Definition statement

This place covers:

- Passive two-terminal electrical components per se that implement electrical resistance as a circuit element, thereby enabling typically a direct proportion between the current and the voltage across the component's terminals.
- Non-adjustable metal resistors made of wire or ribbon, per se, e.g. iron-filament ballast resistors, or metallic glasses therefor, coiled, woven or formed as grids. Configurations thereof may include flexible or folding resistors, changes in dimensions or characteristics of the resistive element from one terminal to another, resistors having sinusoidal or zig-zag configurations or arranged for reducing self-induction, capacitance or variation with frequency.
- Non-adjustable resistors formed as one or more layers or coatings; Non-adjustable resistors made from powdered conducting material or powdered semi-conducting material (excluding loose powder or granular material) with or without insulating material. Resistors whose effective value is varied non-mechanically such as by temperature (thermistors, e.g. exhibiting positive or negative temperature coefficient), voltage (varistors and overvoltage protection resistors) or current (including over-current protection resistors) and having a non-linear behaviour, e.g. typically a sharp change in resistance values upon reaching critical or threshold values of non-mechanical parameters. Compositions and arrangements thereof.
- Non-adjustable resistors consisting of loose powdered or granular conducting, or powdered or granular semi-conducting material, e.g. coherers or like imperfect resistors for detecting electromagnetic waves; overvoltage protection resistors or arresters.
- Non-adjustable liquid resistors.
- Electrical resistors whose effective value is mechanically adjustable, including liquid resistors or adjustable resistors structurally comprising a plurality of resistors, with changing dimensions and/or forms of the resistors, arrangements of fixed resistors with intervening connector or structurally in combination with switching arrangements. Resistors whose resistance is adjustable by short-circuiting different amounts of the resistive element, by mechanical pressure or force, by auxiliary driving means, by resistor movement or by action of actuation means, e.g. contacts, said contacts rocking or rolling along resistive element or taps, sliding along resistive element, e.g. moving along a straight path, in an accurate path or along turns of a helical resistive element.
- Resistors not provided for elsewhere, e.g. structural combinations of resistors excluding impedance networks.
- Apparatus or processes specially adapted for manufacturing resistors adapted for manufacturing resistor chips, for manufacturing resistors with envelope or housing, for winding the resistive element or for coating resistive material on a base, e.g. by thick (including precursor compositions therefor) or thin film techniques (e.g. vapour or chemical deposition, sputtering or flame spraying) by pirolytic processes or by resistor foil bonding; adapted for trimming, for applying terminals or for baking.
- Details common to two or more main types of devices or processes covered by this subclass, e.g. special adaption for mounting; housings, encapsulations; Arrangements for distinguishing marks (e.g. colour coding), electrostatic or electromagnetic shielding, cooling, heating and ventilating or of current collectors; Terminals or tapping points.
- Variable resistors, the value of which is changed non-mechanically, e.g. by voltage, current or temperature.
- Fixed resistors whose effective value is, or is presumed to be, non-variable.
- Details of, or for, resistors.

Ohmic-resistance heating	H05B 3/00
Printed circuits incorporating printed electric components, e.g. printed resistor, capacitor or inductor	H05K 1/16
Printed circuits structurally associated with non-printed electric components	H05K 1/18
Casings for electrical apparatus in general	H05K 5/00
Passive two-terminal components without a potential-jump or surface barrier for integrated circuits	H10D 1/00
Resistors having potential barriers, e.g., field-effect resistors	H10D 1/40 - H10D 1/43, H10K 10/10
Photoresistors and similar semiconductors devices in which radiation controls flow of current through the device	H10F 30/00
Devices using superconductivity or hyperconductivity	H10N 60/00
Solid state devices for rectifying, amplifying, oscillating or switching having no potential barrier	H10N 70/00
Thin- or thick-film solid state devices	H10N 97/00

Special rules of classification

Variable resistors, the value of which is changed non-mechanically, e.g. by voltage or temperature, are classified in group H01C 7/00.

Electrodes and terminals for resistors in main group H01C 7/00 are covered by main group H01C 1/00, more specifically subgroups H01C 1/14 and lower.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

thermistor	type of resistor whose resistance varies significantly with temperature, typically as sharp or sudden change, when a threshold temperature value is reached.
varistor	also referred as Voltage Dependent Resistor is a resistor that conducts significantly increased current when voltage is excessive.
adjustable	mechanically adjustable

Synonyms and Keywords

In patent documents the following expressions/words are often used as synonyms:

Varistor	Voltage dependent resistor

H01C 1/00

Details

Definition statement

This place covers:

- Mounting, Supporting
- Color coding
- Shielding arrangements
- Current collectors
- Terminals
- Resistor networks

H01C 1/012

the base extending along and imparting rigidity or reinforcement to the resistive element (H01C 1/016 takes precedence; the resistive element being formed in two or more coils or loops as a spiral, helical or toroidal winding H01C 3/18, H01C 3/20; the resistive element being formed as one or more layers or coatings on a base H01C 7/00)

References

Limiting references

This place does not cover:

Compensation for resistor expansion or contraction	H01C 1/016
Resistive elements being formed in two or more coils or loops as a spiral, helical or toroidal winding	H01C 3/18, H01C 3/20
Resistive elements being formed as one or more layers or coatings on a base	H01C 7/00

H01C 1/014

the resistor being suspended between and being supported by two supporting sections (H01C 1/016 takes precedence)

References

Limiting references

This place does not cover:

Compensation for resistor expansion or contraction	H01C 1/016

H01C 1/024

the housing or enclosure being hermetically sealed (H01C 1/028, H01C 1/032, H01C 1/034 take precedence)

References

Limiting references

This place does not cover:

Resistive elements being embedded in insulation with outer enclosing sheath	H01C 1/028
Plural layers surrounding the resistive element	H01C 1/032
Housing or enclosure being formed as coating or mold without outer sheath	H01C 1/034

H01C 1/032

plural layers surrounding the resistive element (H01C 1/028 takes precedence)

References

Limiting references

This place does not cover:

Resistive elements being embedded in insulation with outer enclosing sheath	H01C 1/028

H01C 1/034

the housing or enclosure being formed as coating or mould without outer sheath (H01C 1/032 takes precedence)

References

Limiting references

This place does not cover:

Plural layers surrounding the resistive element	H01C 1/032

H01C 1/14

Terminals or tapping points {or electrodes} specially adapted for resistors (in general H01R); Arrangements of terminals or tapping points {or electrodes} on resistors

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Terminals or tapping points in general	H01R

H01C 1/148

the terminals embracing or surrounding the resistive element (H01C 1/142 takes precedence)

References

Limiting references

This place does not cover:

Terminals or tapping points being coated on the resistive element	H01C 1/142

H01C 3/14

the resistive element being formed in two or more coils or loops continuously wound as a spiral, helical or toroidal winding (H01C 3/02 - H01C 3/12 take precedence)

References

Limiting references

This place does not cover:

Resistors arranged or constructed for reducing self-induction, capacitance or variation with frequency	H01C 3/02
Iron-filament ballast resistors; Other resistors having variable temperature coefficient	H01C 3/04
Flexible or folding resistors, whereby such a resistor can be looped or collapsed upon itself	H01C 3/06
Dimension or characteristic of resistive element changing gradually or in discrete steps from one terminal to another	H01C 3/08
Resistive element having zig-zag or sinusoidal configuration	H01C 3/10
Lying in one plane	H01C 3/12

H01C 3/18

wound on a flat or ribbon base (H01C 3/16 takes precedence)

References

Limiting references

This place does not cover:

Resistive elements including two or more distinct wound elements or two or more winding patterns	H01C 3/16

H01C 3/20

wound on cylindrical or prismatic base (H01C 3/16 takes precedence)

References
